BOOKS on BRAIN and NERVES

New. Dr. Noyes gets right down to fundamentals in his new book. He goes very fully into a consideration of all the integrated facts of biology—anatomic, physiologic, chemical, psychologic—and how they produce changes in the organism. He defines clearly all psychiatric terms. Then he presents physiogenic and psychogenic causes, infections, chemicals, drugs, injuries, overwork, etc. Under each disease is a full discussion of every form of modern therapy and management. This is an unusually fine book—clear, definite, and backed by long years of practical experience.

Octavo volume of 485 pages. By Arthur P. Noyes, M.D., Superintendent of State Hospital for Mental Diseases, Howard, Rhode Island. Cloth, $4.50 net

New. Dr. Freeman presents Neuropathology from the anatomic approach. He successfully overcomes many of the difficulties in the diagnosis and treatment of nervous diseases. The book opens with a discussion of cytology and cytopathology and follows through with chapters on the meninges and their diseases, vascular disease and arteriosclerosis, inflammations of the brain, cord and nerves; tuberculosis, syphilis, leprosy, fundus infections and parasites; intoxications, including the newly-recognized "jake paralysis"; injuries, functional psychoses, senile dementia, epilepsy, malformations, degenerations, intracranial tumors.

Large octavo of 349 pages, illustrated. By Walter Freeman, M.D., Ph.D., D.N.B., F.A.C.P., Professor of Neurology, George Washington University. Cloth, $4.00 net

Fourth edition. Dr. Ranson has given his book, both text and illustrations, a very thorough revision. The illustrations form a valuable feature. They are of exceptional excellence and numerous, numbering 341, 14 of them in colors. Of great value are those of the internal capsule, several of which are entirely new views. The series of sections through the brain stem and basal ganglia, each accompanied by a key figure showing the plane in which the section was cut, makes this work absolutely the finest in its field.

Octavo of 478 pages, with 341 illustrations, some in colors. By Stephen W. Ranson, M.D., Professor of Neurology and Director of Neurological Institute, Northwestern University Medical School, Chicago. Cloth, $6.50 net

NAME .................................................. ADDRESS ..................................................

Entered as second-class matter July 16, 1923, at the Post Office at Lancaster, Pa., under the Act of March 3, 1879.
For research purposes we offer
Pure, Crystalline
CAROTENE
(Pro-Vitamin A)
of highest vitamin A activity. This is the first fraction of carotene crystals from the ether extract of dried carrots. It is relatively rich in beta carotene, which is believed to be twice as potent biologically as alpha carotene. [Professor Richard Kuhn, Chemistry and Industry 52, 981 (1933)].
Biochemists and physicians are increasingly interested in the functions of carotene in man and in animals because of its presence in the blood stream and in various organs, and its relation to the building up of resistance to infections.
This makes it important to have a source of pure carotene of known potency for accurate investigation of these and related problems. We are supplying carotene of high purity to leading research and educational institutions in this country and abroad, for research investigations and for lecture demonstration.

Let Kewaunee Engineers Untangle Your Crowded Classroom Problems
No Charge for this Service
The easiest and the most inexpensive way to untangle crowded classroom problems is to call in an expert who knows how to rearrange or change your furniture so as to accommodate comfortably the largest number of students.
By following the advice of Kewaunee experts many schools have increased the size of their classes, have added new subjects and have found that proper furniture, properly arranged, not only made new buildings unnecessary, but provided extra room for other classes.
If your school has crowded laboratory classes, write us at once for our free engineering service. Find out at our expense, what is necessary to increase your classroom capacity.

Chemical Apparatus Assemblies
CENCO
CORK BORING APPARATUS
Bores a Straight Hole Every Time.

No. 3271
The cork to be bored is firmly clamped on the cutting table by the circular clamp and cork borer guide. When in position, it is impossible to make other than a perfectly straight clean hole through the cork. A set of ordinary hand cork borers, which are easily sharpened, are supplied with each cork boring apparatus.

No. 3271 . . . $10.00

Stop Guessing—
USE A CORK GAGE!
This small etched aluminum cork and rubber stopper gage no longer makes it necessary to carry a flask or bottle to the storeroom to try corks until a fit is secured. Just read the number appearing on the gage above the opening to be stoppered and reach for that size of cork or stopper. It fits every time.

NEW YORK—BOSTON—CHICAGO—TORONTO—LOS ANGELES
If you have experienced the inconvenience and awkwardness of the ordinary one-piece cast-iron tripods, with their fixed leg length, massive construction, and excessive weight, you will instantly recognize and welcome the advantages offered in these two new Milvay Tripod Centers.

With them, the form and size of tripods that best suit specific apparatus set-ups can be quickly assembled. Their size can be instantly changed by the mere substitution of longer or shorter leg-rods . . . their upright rods can be conveniently adjusted through a vertical range . . . they can be easily levelled by merely moving the leg-rods in or out of their sockets . . . when not needed they can be quickly dismantled and stored in a small space . . . they present a neater appearance and permit a substantial saving. Then, too, with these new Milvay Centers, tripods of unusual spread, height and stability can be quickly assembled—tripods, that, regardless of size, provide more-stability at less weight.

Each style of Milvay Tripod Center is made in two sizes: the small size for 13 mm. rods, and the large size for 19 mm. rods. For further information and prices ask for Bulletin No. 146.

For over a quarter of a century, the name Milvay has stood for apparatus of quality and dependability, at low cost. That is why we believe you and every other science teacher will want to refer to this catalog whenever supplies are needed. If you haven't a copy already just ask for catalog 42—free to every Educational Institution.
A New Catalog on
"JAGABI" RHEOSTATS

In addition to describing the latest design and numerous types of Jagabi Rheostats, this Catalog includes valuable data—not published heretofore—on how to select in terms of (1) fineness of adjustment, and (2) rise in temperature.

It shows briefly and concisely how to determine which size and rating will best meet a given need; and the probable temperature rise for a given load or number of watts being dissipated.

MANUAL OF THE SOUTHEASTERN FLORA
(ILLUSTRATED)

Being Descriptions of the Seed-Plants growing naturally in North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee and Eastern Louisiana

By JOHN KUNKEL SMALL

This Manual replaces the author's Flora of the Southeastern United States, published in 1903 (second edition 1913), for the Southern States east of the Mississippi River. It embodies the results of continued exploration and study, thus bringing up to date our knowledge of this floral region.

The Manual is the only complete illustrated work on the flora of the Southeast by a recognized authority.

In addition to analytical keys to the various plant groups, and descriptions of the orders, families, genera, and species, regional or altitudinal and geographic distribution, there are xxii + 1554 pages and over 1500 illustrations, one illustration of a species of each genus.

ROLLER-SMITH Model B Precision Balances

are recommended for the rapid and accurate weighing of objects of any kind over a range of .002 milligram to 50 grams; also for rapidly determining the surface tension and specific gravity of liquids.

They are easy to operate, direct reading and very rugged. The object to be weighed is hung on the hook (6), the beam lock (5), released, the index lever (1), moved until the small pointer (3), at the right is at zero and the weight of the object then read direct on the dial.

They are used by the Bureau of Standards and by many leading educational institutions, hospitals and industries.

Send for Bulletin AJ-210 which gives full details and the outstanding features corresponding with the numerals shown in the cut at the left.

Mercury Condensation Pumps

PAYNE type—all metal; two stage. Volume capacity: 15,000 cc. per minute. Pull down: 1/10,000 micron in a closed system under proper conditions. Built to operate against 100 micron maximum back pressure.

Heavy gauge metal throughout. Exceptionally rugged from standpoint of leaks. Ports and passages relatively large to minimize the effects of contamination caused by foreign materials or leaks in the system.

High vacuum end of pump terminates in a cup fitted for a four inch bell jar. Cup is 1½ inches deep so that a suitable wax joint can be readily made. Overall height of pump approximately 32 inches. About 16 inches square of floor space required. Each pump furnished with supporting stand, electric heater, 6 feet of connecting cord. Unless otherwise specified, 110-volt heaters are supplied. Prices on request.

YEARS ago, Spencer Lens were the first to make a practical substage lamp of the type now so universally used. Now they present a new improved Substage Lamp. Of primary importance is the bakelite construction—which does not heat up as does metal—will not bend or break with ordinary use—and is less costly. The ventilation is much improved and minor refinements, such as its being of two-piece construction, all edges and corners smoothly rounded, make this lamp actually much nicer to handle. Each lamp is provided with five feet of flexible cord, with plug.

Lamp No. 385-A—Lamp with the blue glass ground on one side. . . . $3.00

Lamp No. 385-B—Lamp with Daylite glass substituted for blue glass . . . $3.75

EDWARDS GAS DENSITY BALANCE

WITH IMPROVED BEAM CONSTRUCTION RESULTING IN GREATER ACCURACY THAN HERETOFORE

EDWARDS GAS DENSITY BALANCE. Based on the principle of Boyle's law, i.e., the density of a gas is proportional to its pressure, and the buoyant force exerted upon a body suspended in a gas is proportional to the density of the gas and, therefore, to its pressure. Hence, if the buoyant force exerted upon a body is made the same when suspended successively in two gases, then the densities of the two gases must be the same at these pressures; or the densities of the two gases at normal pressure are in inverse ratio to the pressure when of equal buoyant force.

The apparatus consists of a balance beam carrying a sealed Pyrex glass cylinder on one end and a counterweight on the other. It is supported on specially hardened and threaded steel pins, carefully pointed and hand honed to fit into agate bearings. The latter are so shaped that the beam will retain its central position. This construction has materially increased the accuracy over that obtainable with former models and is more easily adjusted. The balance beam with its support is mounted in a gas-tight chamber to which is attached a mercury manometer.

In operation, the balance case and manometer connections are filled with dry air and the pressure adjusted through a needle valve until the beam just balances, as determined by observation of the cross line on the end of the beam. When equilibrium is reached, the pressure on the manometer is read and the atmospheric pressure is determined from a barometer. The balance case is then evacuated and filled with the gas of which the specific gravity is to be determined. Pressure is then adjusted until the beam is again in equilibrium. Temperature is kept constant, or the effect of variation is calculated.

The specific gravity of the gas is the ratio of the total pressure (manometer reading plus atmospheric pressure) required to balance the beam in air to the total pressure required to balance it in the gas.

A more complete discussion of the method, its possible sources of error, and details of operation will be found in "Technologic Paper No. 89" of the U. S. Bureau of Standards.

5980. Edwards Gas Density Balance, 1933 Model, as above described, complete with manometer and sufficient mercury for charging same, in carrying case, with detailed directions for use

Four Important New Books

Theory of Elasticity

By S. Timoshenko, Professor of Engineering Mechanics, University of Michigan,
*Engineering Societies Monographs*. 415 pages, $5.00.

This book by an international authority covers the subject particularly in relation to the calculation of stresses in engineering structures and machine parts. It gives the necessary fundamental knowledge of the theory of elasticity, together with the solution of various problems of practical importance.

Fundamentals of Hydro- and Aeromechanics

This is the first of two volumes making available many of the data and results of Dr. Prandtl's researches in aerodynamics and streamlining. The books are written so that each may be used separately, and both are marked by a strong effort to relate more closely theoretical analysis and experimental developments. This volume covers the fundamentals of hydrodynamics and their applications to engineering problems. The book gives a concise treatment of hydrostatics and a more elaborate treatment of aerostatics.

Applied Hydro- and Aeromechanics

This, the second volume, gives a comprehensive review of the modern theories of hydro- and aerodynamics, discussing wing theory, wind tunnel tests, and many other experimental methods.

Chemical Engineers' Handbook

Here is a reference book of chemical engineering comparable in all ways to standard manuals in other fields. More than 2600 pages of dependable and useful facts, figures and methods are given, covering not only chemical engineering but also the related fields. Sixty specialists, with the cooperation of over 150 chemists and engineers, offer the latest usable material not only on fundamental unit processes, but also on such subjects as electrochemistry, high pressure technique, materials of construction, fuels and fire protection.
