PACKCHANIAN
ELECTROPHORESIS APPARATUS

For the Isolation of Certain Protozoa from a Mixture of Bacteria and Protozoa, and for the Studying of Electrical Charges and Velocities of Filterable Viruses.

Consists of a series of cells which can be easily isolated from each other thus facilitating seven or more definite samplings from anodal and cathodal sections without diffusion of liquid. Apparatus can be sterilized.

New Work

The Phenomena of Life
A Radio-Electric Interpretation

By

George Crile

After years of research Dr. Crile at last has found a clue to the fundamental nature of living processes. In this book he presents his theory which suggests a physical line of ascent from atom to man, the argument to support that theory and the experimental data on which it is based. Illustrated. $3.50

The Philosophy of Physics

By Max Planck

The dean of living physicists here sums up his philosophy of physics. A work of commanding interest. $2.00

20th Century Psychiatry

By W. A. White, M.D.

The development of psychiatry from the beginning of the century to the present. $2.00

Men of Science

By J. G. Crowther

The absorbing story of five great scientists, Davy, Faraday, Thompson, Joule, Maxwell, who revolutionized the course of science throughout the world. $3.50

Those Were Good Days!

By Carl L. Schleich

The lively memoirs of the world-famous surgeon who was the pioneer in local anesthesia. Illustrated. $3.50
NEW SPENCER LAMP

For Use with Binocular Microscopes

A NEW LAMP—designed to give sufficient illumination for binocular microscopes using objectives of high magnifying power. It is small, inexpensive and is equipped with a standard 100-watt, 120-volt bulb that may be purchased at any electrical supply store.

This Spencer No. 361 Lamp is so well ventilated that it may be handled at any time. The visor is so arranged over the light opening that when the lamp is ten or twelve inches from the microscope the eyes at the eyepieces are shaded.

Folder M-65 completely describes this Spencer No. 361 and other Microscope Lamps. Please address your request for this folder to Dept. A-2.
Above is shown a 4" square Triplett Milliammeter—Note its modern style. All Triplett instruments show this up-to-date smart appearance. They are accurate, easy to read, and compact in size.

In the laboratory, on the panel or installed as standard equipment on electrical equipment, they add distinction and up-to-date efficiency.

TRIPLETT MANUFACTURES
A complete line of electrical measuring instruments for radio, electrical and general industrial purposes both standard and custom built. See them at your jobbers. If you have an electrical instrument problem write to TRIPLETT.

A SIMPLIFIED PROCEDURE FOR THE VOLUMETRIC MEASUREMENT OF SERIALLY SECTIONED STRUCTURES

Biologists have frequently been able to determine the volume of glands, etc., too small or diffuse to be otherwise handled by outlining serial sections and measuring the outlines either by cutting out and weighing or by use of a draftsman's planimeter. The use of this latter instrument is somewhat simpler, though in either case the method is laborious.

In extensive use of this technique the author has found it possible to so simplify the procedure that, aside from the preparation of the slides, very little effort is involved.

The outlines, by projection or camera lucida, are prepared in sequence on a continuous sheet of wrapping paper. The planimeter is set upon a large sheet of heavy clear celluloid (or other thin flat transparent material) which is tacked down at the ends. A pin-hole near the center is made and marked as the starting point. The celluloid sheet should be large enough so that in all measurements the planimeter rides entirely upon it.

The sheet with outlines are slipped under the celluloid and a point on the first perimeter is brought under the starting point. The pointer is traced around, measuring the first outline. Then without disturbing the planimeter the outline sheet is slipped along until a point on the next outline is under the starting point. When this is measured the planimeter automatically adds its area to that of the preceding. If it is desired to subtract any particular part of the outline the planimeter is run backwards. The final sum of the areas is given by one reading of the planimeter. From this and the thickness of the sections the volume is calculated.

By this method a gland involving over one hundred sections can be carefully outlined, measured and checked in less than two hours. A comparison with the paper weight method showed somewhat less variability and the further advantage of giving actual volumes.

BOOKS RECEIVED

The American Journal of Anatomy
Published by The Wistar Institute
Charles R. Stockard, Managing Editor, Cornell Univ. Med. School

Vol. 58 Contents for March, 1936 No. 2

H. B. van Dyke and G. Ch'en. Observations on the biochemistry of the genital tract of the female macaque particularly during the menstrual cycle. Three text figures and three plates.

G. B. Wislocki and L. S. King. The permeability of the hypophysis and hypothalamus to vital dyes, with a study of the hypophyseal vascular supply. Twenty-eight text figures.

E. M. Glidden and C. F. De Caris. Arteries of the chimpanzee (Pan spec. ?): I. The aortic arch; II. Arteries of the upper extremity; III. The descending aorta; IV. Arteries of the lower extremity. Seven text figures.

M. M. Wintring and H. B. Shumacker, Jr. Erythrocyte studies in the mammalian fetus and newborn. Erythrocyte counts, hemoglobin and volume of packed red corpuscles, mean corpuscular volume, diameter and hemoglobin content, and proportion of immature red cells in the blood of fetuses and newborn of the pig, rabbit, rat, cat, dog and man. Eight text figures.

G. H. Daron. The arterial pattern of the tunica mucosa of the uterus in Macacus rhesus. Eleven plates.

H. B. Latimer. Weights and linear measurements of the adult cat.

Price $7.50 per volume, Domestic; $8.00 per volume, Foreign
Issued bimonthly
Many early volumes are still available. Prices upon request

STAIN TECHNOLOGY
A JOURNAL FOR MICROTECHNIC

Beginning with the January number of this journal, the section entitled LABORATORY HINTS FROM THE LITERATURE has been increased in size.

Each number of the journal now contains between 75 and 100 abstracts of papers giving technic in all fields of microscopy, as well as papers dealing with the biological uses of dyes. Each abstract not only indicates the procedures included in the original article but gives the author's technic in sufficient detail to follow without having to consult the original paper. STAIN TECHNOLOGY thus truly becomes, as implied by its sub-title, A JOURNAL FOR MICROTECHNIC.

Issued quarterly

Subscription $2.25 a year
