TEXTS on BACTERIOLOGY

Just Ready—New (3rd) Edition. This textbook on Elementary Bacteriology was so thoroughly revised that the entire book, from beginning to end, had to be completely remade. In addition to thorough revision of the chapters on microorganisms, the phosphorus cycle, milk and other food products, bacteria as the cause of disease, and immunity, four new chapters were added. These deal with Yeasts and Molds, Bacterial Variations, Chemical Activities of Bacteria, and the Influence of Chemicals on Bacteria.

Dr. Greaves presents his subject in a way that students will find most absorbing and interesting. The student first learns of the development of Bacteriology as a science. He is given the underlying theories and principles upon which the study is built. He is given the newest knowledge on the forms, functions, and characteristics of bacteria, and then the present-day application of this knowledge to the life of man, to the arts and industries, to disease prevention.

12mo of 562 pages, illustrated. By Joseph E. Greaves, M.S., Ph.D., Professor of Bacteriology, Utah Agricultural College, Logan; and Ethelyn O. Greaves, M.S., Ph.D. Cloth, $3.50 net.

Just Ready—An Entirely New Text. This new text fills a specific need in that it is brief yet complete, simple in presentation, well organized, and adheres constantly to the essentials necessary for the proper application of the facts taught. Dr. Rice presents his subject under three main divisions: General Bacteriology; Individual Types of Bacteria in Relation to Disease; and Immunity. He clearly explains and illustrates the forms and structures of bacteria. He tells how to use and how to care for the microscope. He details staining and culture methods and he considers the individual type of bacteria in relation to a wide range of diseases.

Under Immunity he gives the student all the important tests and therapeutic procedures. He gives him everything in this field that has been proved valuable.

Octavo of 551 pages, illustrated. By Thurman B. Rice, M.D., Professor of Bacteriology and Public Health, Indiana University School of Medicine. Cloth, $5.00 net.

New (11th) Edition. Dr. Jordan literally tore down and rebuilt his book for this new edition. He thoroughly revised every page. He rewrote many of the subjects and he added a great deal of new material.

This text covers the entire field of Bacteriology, both pathogenic and non-pathogenic. It includes equipment, tests, types of bacteria—their characteristics, effects, modes of transmission, etc. Moreover, throughout the entire book Dr. Jordan has applied the facts to medicine, disease prevention, the arts and industries. This book, long recognized as a foremost authority, has been brought strictly down to date in this new (11th) edition.

Octavo of 825 pages, illustrated. By Edwin O. Jordan, Ph.D., Professor of Bacteriology, University of Chicago. Cloth, $6.00 net.

You Save Three Ways with KEWAUNEE Furniture

- It Serves Years Longer
- It Uses Space More Economically
- It Saves You Money on First Cost

When buying laboratory furniture, look to the savings and efficiency it brings long after price is forgotten. Kewaunee Furniture will serve for many years under severest use. It is pedagogically correct. Teachers handle larger classes—students do better work—classrooms are available every period.

If you have a laboratory to furnish, be sure to use Kewaunee’s FREE Engineering Service. It’s the sure way to avoid costly mistakes. Write us today.

1935 AIR COOLED MODEL
BOEHNKE ROTARY AIR BLAST AND SUCTION APPARATUS

ROTARY AIR BLAST AND SUCTION APPARATUS, Boehnke 1935 Air Cooled Model. Offered as more convenient and less expensive than the water jacketed model previously supplied under No. 1035—see page 5 of our catalogue. Of similar specifications, i.e. maximum pressure 18 to 20 lbs. per sq. in., free air approximately 1.5 cu. ft. per minute, maximum vacuum 18 to 20 inches of mercury.

The new model is suitable for continuous operation and is provided with wool packed pocket under the shaft ends that constantly supplies the bearings with oil. This pocket holds enough oil to last for several days constant running and can be readily replenished. Oil does not invade the air stream and the oil filter previously supplied is therefore not required with this model.

Inlet and outlet tubulations are provided with adjustable collars to vent them so that the pressure or vacuum can be adjusted to the requirements of the work intended.

1034-A. Rotary Air Blast and Suction Apparatus, Boehnke 1935 Air Cooled Model, as above described, on small metal base with holes for attaching to laboratory table. With single groove pulley, but without motor .................................................. 15.00

1034-B. Ditto, but directly connected with 1/6th h.p. motor, 1750 r.p.m., for 110 volts, 60 cycles a.c., mounted on base 7½ x 12½ inches, with rubber feet to absorb shock ....................... 60.00

1034-G. Ditto, Double Unit, consisting of two No. 1034-A Pumps directly connected with ½ h.p. motor mounted between them on base 20 x 8 inches with six rubber feet. Convenient where both pressure and vacuum are desired at the same time but completely independent from each other; also suitable for double pressure or vacuum—by parallel connection—on one machine without the expense of two motors. With motor for 110 volts, 60 cycles, a.c. .............................................. 67.50

"It's for You"

Who can estimate the value of the telephone in the daily lives of millions of men and women... in time and money saved, in increased efficiency, in security and priceless help in time of need! Contact, communication, swift interchange of ideas—these benefits the modern world offers you. The telephone is one of the chief instruments by which you can seize them. With it at your elbow you are ready for what may come—for opportunity, for emergency, for the brief word that may open a fresh chapter in your life.

Now in Effect—Special Sunday Rates for station-to-station Long Distance telephone calls, and Reduced Person-to-Person Rates after 7 Every Evening and All Day Sunday. The reductions apply, in general, to calls on which the day station-to-station rate for three minutes is more than 35 cents.

Bell Telephone System
ONLY skilled hands make the laboratory glassware that carries the trade-mark "Pyrex". They are the hands of expert workmen whose chief concern is the fabrication of technical glassware.

More than this, their work is guided by chemists, physicists and engineers who are leaders of progress in this field; they are supplied with the most modern and complete tools of their trade; and they work with the material that gives fullest scope for their skill—"Pyrex" Brand heat-resistant glass.

In making the more elaborate apparatus, they deal with lamp-blown blanks of uniform wall thickness. The skill and thoroughness of master craftsmen have made products of the Corning Lamp Shop famous for superior strength, uniformity and reliability.

Your investment in laboratory glassware is best protected by making sure each piece, from a test tube to the most complicated piece of apparatus, carries the mark "Pyrex".

"Pyrex" is a registered trade-mark and indicates manufacture by

FOR
BARD-PARKER
KNIVES AND SCISSORS

Bard-Parker Knives and Scissors bring to dissecting work in Biology and allied sciences the same sharp, detachable blade as used in the Surgery.

The Bard-Parker Company originated—and have made for 19 years—its standard detachable blade surgical knife. Their recent introduction of the new Rib-Back blades represents a further improvement. The Rib-Back, literally a BACK-BONE is an integral part of the blade. It cannot come off, it possesses far greater rigidity and strength, it will not "weave" in an incision, and there is no possibility of the back of the knife cutting the glove. Like all Bard-Parker blades, the Rib-Back Blade is Sharp, instantly replaceable and available in a wide assortment of sizes and shapes.

Bard-Parker stainless steel Scissors have renewable edges, practically eliminating scissors replacements and facilitating dissecting technique because the edges are uniformly sharp.

Bard-Parker Knives and Scissors with renewable edges are not only more convenient and efficient but also decidedly more economical than conventional types.

A New Development of First Importance in All the Sciences

Polaroid

The New Light Polarizer

Unlimited in Area
Low in Cost

Polarized light is now available for convenient use in unlimited areas—freed from all the limitations of the Nicol prism.

Polaroid is available in glass discs of any required area. It polarizes by simple transmission.

The smallest standard Polaroid disc has over four times the area of the largest Nicol prism regularly available—and costs only one-seventh as much. It offers an entirely new order of convenience and economy in the present applications of polarized light—and opens for development many fields which have remained relatively unexplored because of the inconvenience, limited apertures, and high cost of prismatic polarizers.

Polaroid offers unusual opportunities for the study and classroom demonstration of polarized light—for large scale study of strains in transparent material—testing of glassware—the study and even the lantern-slide projection of interference colors of crystals—light intensity control—chemical determinations—measurement of gloss—the study of superimposed independent color fields—non-glare surface study of paper, textiles, etc.—electro-optical shutters (Kerr cells) for velocity of light experiments, television, and facsimile work—studies in experimental psychology involving binocular vision and independent images—improvised conversion of standard optical instruments to polarizing instruments—control of the glare of specular reflections of sky light.

THE FITZ MICROMANIPULATOR WITH
twelve important features

1. Grouped controls which permit selection and actuation with one hand.
2. Co-ordinated controls which produce natural movement under the microscope.
3. Complete bilateral symmetry by means of a right and left hand arrangement of controls.
4. A device for immediate return to operating position after withdrawing for setting or changing the moist chamber, tools, etc.
5. Sturdy, wearproof differential screw and wedge action.
6. May be operated from either side, front, or rear of optical axis, or from intermediate positions.
7. Simplicity of technique.
8. Full attention can be given to observation.
9. Ease of selection and rotation of controls.
10. Rapid operation.
11. Sturdy construction means durability.
12. Specimen may be attacked from any azimuth.

ing pipette from contamination as well as the mouth of the bottle during the process of collecting the vaccine. The collecting tube is connected serially by means of a rubber tube with two sterile bottles and a bottle of 5 per cent. phenol (see Fig. 2). The bottle of phenol is connected with a suction pump, and the bacterial suspension is collected by means of suction. A clamp (6) at the top of the collecting tube stops the suction as soon as the growth of the individual bottle is delivered into the vaccine-bottle and the collecting tube is withdrawn from the bottle into the outer glass tube. Thus the tip of the tube is protected and no air is allowed to be drawn into the vaccine bottle.

When the growth from all the bottles is collected, the suction pump is stopped, and air is allowed to flow through the phenol. This sterilizes the air before it enters the bottle of vaccine and fills the vacuum there. The collecting pipette is then disconnected, and the two-hole stopper in the vaccine bottle is replaced by a sterile solid rubber stopper.

This apparatus has been used successfully in our laboratory for the past year. It facilitates the preparation of bacterial vaccines in that it saves time and labor and reduces contaminations to a minimum.

I wish to express my appreciation to Miss Mildred Melman for making the drawings from the model.

LUCY MISHULOW

THE PRODUCTION OF HIGH VELOCITY IONS FOR THE DISINTEGRATION OF ATOMIC NUCLEI

LAWRENCE has been able to give in the cyclotron a multiple acceleration to positive ions in a uniform magnetic field and has obtained very high velocities of the particles. Thus energies of the order of seven million electron volts have been attained, and an increase to ten million should be accomplished soon. In the cyclotron the ion is accelerated twice by the high frequency electrical field during each (approximately) circular orbit.

In experiments on a small apparatus it is proposed to endeavor to apply the use of a three-phase oscillator system to give either three or six accelerations per revolution of the positive ion in its orbit. If successful this should make it possible to attain much higher equivalent voltages. The principal difficulty involved is that of getting a satisfactory high-frequency, high-voltage, three-phase oscillator system.

Consideration of the simplest and least effective application of a three-phase potential, such as that in which it is connected to a trisection electrode cyclotron, for example, as compared with a duant cyclotron, leads to the following results: An ion is accelerated three times instead of two times per circuit. The ion density is reduced 50 per cent. The capacity of the electrode is reduced 33 per cent. The proper sequence of accelerating voltages in a forward direction occurs every 120 electrical degrees. In the reverse direction the proper sequence occurs only half as often, i.e., every 240 electrical degrees. Resonance is preferred in the forward direction. In the duant type the accelerating potential in both the forward and reverse directions occurs 180° apart. The magnetic field frequency of the oscillating potential and the root mean square high frequency potential are the same in both cases. The use of six electrodes instead of three would be much more efficient.

SHULL'S

EVOLUTION

By A. FRANKLIN SHULL
Professor of Zoology, University of Michigan

McGraw-Hill Publications in the Zoological Sciences

309 pages, 6 x 9, illustrated, $3.00

Here is a readable general treatment of evolution which approaches the subject from the viewpoints of the outdoor naturalist who presents phenomena to be explained, and of the laboratory worker who would interpret them. The statement of facts of evolution is reduced to a minimum; the bearing of modern genetics on the process is stressed throughout, and genetic discoveries up to 1935 are dealt with. The author's point of view is that the student is chiefly interested in the how and why of the subject of change of species—how evolution must work in the presence of the typical heredity mechanism. Thus the book is mainly concerned with initiating causes and guiding agencies, although the history of the idea and of evolution itself is also discussed.

McGRAW-HILL BOOK COMPANY, INC.
330 West 42nd Street, New York

Aldwych House, London, W.C.2
A textbook for courses in the psychology of motivation

A reference book for courses in human and animal behavior, educational, social and applied psychology, and specialized courses

In the last few years the experimental study of motivation has come rapidly to the forefront of psychological research. Its fundamental importance to the science is more and more plainly recognized. Because of its comparatively recent development, however, there has been up to the present time no textbook suitable for use in a course covering the subject. To supply that lack, Professor Young has prepared this new book, based on his investigations and readings in the literature for many years.

For three semesters the material in the book has been thoroughly tested by actual use, in lithoprinted form, at the University of Illinois, and for one semester at Stanford University. Its teachability is thus assured. Furthermore, the book includes reports of the most recent experiments in the field, and is therefore entirely up to date. Parts of it contain reports of the author's own researches, some of which have never before been published. Throughout the book the attempt is made to preserve an impartial viewpoint in regard to the several schools of psychological thought existing today in the study of behavior. This enables the student to acquire a scientifically unprejudiced picture of the various aspects of motivation.

The approach is factual: Speculation and theory have been strictly subordinated to the presentation of laboratory findings based for the most part upon experiments which have been carried out during the past ten or fifteen years. An excellent bibliography is appended at the end of each chapter, listing the more pertinent guides to the available sources. An important feature is the section at the close of the book giving questions and exercises designed to aid the beginning student in study and review of the materials in the different chapters.

CONTENTS: The Problem; The Energetics of Activity; Animal Drives; Drive and Purpose; Direction and Regulation; Positive and Negative Behavior; Psychological Hedonism; Social Motivation; Emotion and Motivation; The Dynamic Interplay of Motives; Questions and Answers; Index.
