Ready!—1936 Mayo Volume

RAPIDLY SELLING OUT OF PRINT!
THIS EDITION IS STRICTLY LIMITED!

The New (1936) Mayo Clinic Volume is just off press. We know that you will pronounce it one of the most useful and informative volumes that has ever come from this famous Clinic. There are 235 contributions in this new volume, recording the original work and findings of the Mayos and their Staffs. In addition there is a great list, by titles and other bibliographic data, of all the important contributions of the Staffs during the past twelve months.

There is authority behind this book and a great wealth of clinical material. The book is up-to-date. It records the very newest developments in diagnosis and treatment. There are laboratory tests with their bedside or operating-room interpretation. There are new technics, new drugs, new diets, new serums. All this new material is applied to practical medicine and surgery.

The important point about these contributions is that they are based on a great wealth of clinical material and systematically cover every region of the body—alimentary canal, genito-urinary organs, ductless glands, blood and circulatory organs, skin, syphilis, head, trunk, extremities, chest, brain, spinal cord, and nerves. 1350 pages of truly important findings—a great wealth of material that can be had in no other way, that can be had only while this present printing lasts.

STRICTLY LIMITED EDITION. We bring this to your attention because every year this volume sells out of print. It is never reprinted. Prepublication orders this year have been greater than ever before, 80% of the printing having been sold before the volumes come in from the bindery. We urge you, therefore, to place your order at once so as to assure yourself a copy of this fine book.

NAME .......................................................................................... ADDRESS ...........................................

Entered as second-class matter July 18, 1923, at the Post Office at Lancaster, Pa., under the Act of March 3, 1879.
It is no accident that institutions of wealth and position in the educational world, critical in their selection of all things, are constant users of Milvay Products. Obviously price is not the only factor that bears weight in making their decisions. The reasons for this choice are found in the care with which this company selects its raw materials, the effort it makes to develop efficient manufacturing processes and the time and money expended to train expert craftsmen.

The accelerated swing towards the name Milvay makes it possible and imperative, as we enter our 29th year, to pledge an even higher degree of quality. For, our reputation is a coveted possession, too priceless ever to jeopardize by allowing anything less than the best to bear the Milvay name. You will save money; find it more efficient and satisfactory to depend on the authoritative and complete Milvay Catalog as your source of supply. If you haven’t a copy, write us today.

**CHICAGO APPARATUS COMPANY**

1735 N. Ashland Avenue

Chicago, Illinois
IN 1892 Dr. Henri Van Heurck* wrote in his book, "The Microscope": "The firm of Spencer...in 1848 made objectives noted as surpassing those made in Europe. In 1852 Spencer manufactured a 1/12 inch objective having 174 1/2", the first having so large an angle of aperture."

Since these early days the superiority of Spencer objectives has been consistently maintained, and mechanical refinements introduced to add to their effectiveness. Today, Spencer is the only manufacturer who burnishes the front lens of the oil immersion objective between two metal shoulders. The lens will not become loose or drop out due to the cleaning solution dissolving the cement used in the usual construction.

This oil immersion lens is permanently aligned for life by special machines designed by Spencer and operated by their skilled craftsmen. It is one of the many details made possible by the application of laboratory technique to factory routine—that enables you to utilize completely the perfection of Spencer optics. It is a definite reason why, in purchasing a microscope, your choice should be a Spencer.

* Dr. Van Heurck was President of Belgium Microscopical Society and a Fellow of the Royal Microscopical Society and others.

Good Neighbors

The Bell System serves
the whole country, yet it remains close
to the people. The people use it. Their
savings built it. "It belongs to Main
Street."

The 270,000 employees of the Bell
System live and work in your neighbor-
hood and in similar neighborhoods in
every section of the country. They are
good neighbors. Thousands of times
each day and night their activities bring
friendly aid to those in need.

To every one—to the newlyweds, to
the man in the grand house on the hill
or the little lady with the shawl—the
Bell System offers the same full measure
of service.

And seeks to do it always with courtesy
and sympathetic understanding
—in the manner of a friend.

BELL TELEPHONE SYSTEM
VARIABLE WEIGHT OUTFIT

STORMER VISCOSIMETER

For use with materials requiring adjustment of weight to produce a predetermined rate of shear

7649-M. Viscosimeter, Stormer, Variable Weight Outfit. For use with materials requiring adjustment of weight to produce a predetermined rate of shear at, for example, in the control of the consistency of Drilling Mud where the standard procedure is the determination of the weight necessary to produce one hundred revolutions of the cylindrical rotor per minute; also chosen for use with vat printing pastes as it permits the rate of shear to be varied as much as a thousand fold. See Sivert N. Glarum, Research Associate, American Association of Textile Chemists and Colorists, "A Fundamental Study of Vat Printing Quality," American Dyestuff Reporter, Vol. XXV, No. 6 (March 23, 1936), p. 150.

Suitable for many similar materials of colloidal character where a change in the rate of shear changes their structure.

While the standard weight box filled with shot, as furnished with the No. 7649 General Purpose Outfit, can be used, we offer as more convenient a special weight carrier, No. 7653-C, similar to the pans and bows of an analytical balance, on which standard analytical balance weights can be used. This carrier is constructed of aluminum to keep the weight to a minimum, i.e. approximately 11 grams.

7649-M. Viscosimeter, Stormer, Variable Weight Outfit, as above described, complete in case with thermometer and test cup provided with two side vanes, central baffle and thermometer holder as in No. 7649 General Purpose Outfit but with aluminum weight carrier in place of the usual weight box. Without balance weights shown in illustration

Code Word ................................................................. 110.00
Leuga

7653-C. Weight Carrier, only, of aluminum, for use with standard analytical balance weights. As supplied with No. 7649-M Variable Weight Outfit

Code Word ................................................................. 1.75
Levpr

The above instrument and that with Fork Type Rotor (description sent on request), are offered in addition to the 1931 Model described on pp. 595 and 596 of our catalogue.

New Books—New Editions

SEMI-MICRO QUALITATIVE ANALYSIS

By CARL J. ENGELDER, Ph.D., Professor of Analytical Chemistry, University of Pittsburgh, TOBIAS H. DUNKELBERGER, University of Pittsburgh, and WILLIAM J. SCHILLER, Mount Mercy College.

Here the methods and technique of microanalysis are applied to the ordinary (macro) schemes of qualitative analysis in order to confine the operations to drops, or, at most, to one or two cubic centimeters of solution; to develop a micro scheme suitable for undergraduate students taking their first course in qualitative analysis; and, by dispensing with the use of microscopes, to bring the micro technique within practical economic and pedagogic reach of large laboratory courses of sophomores and even freshman students.

Ready in June
Approximately 255 pages; 6 by 9; Probable price, $2.75

INTRODUCTION TO THEORETICAL SEISMOLOGY

Part I. Geodynamics

By JAMES B. MACELWANE, S.J., Professor of Geophysics and Director of the Department of Geophysics, St. Louis University.

There is no work similar to this in the English language. It is intended as a textbook and working manual for advanced classes in seismology. It may, however, be used in graduate classes in elasticity, wave motion and applied mathematics. The book offers a clear and competent treatment of elasticity, the propagation, reflection and refraction of elastic waves, and the paths and velocities of earthquake waves in the interior of the earth.

Ready in July
Approximately 354 pages; 6 by 9; Probable price, $6.00

SYNTHETIC INORGANIC CHEMISTRY

Fifth Edition

By ARTHUR A. BLANCHARD, Professor of Inorganic Chemistry, JOSEPH W. PHelan, Late Professor of Inorganic Chemistry, and ARTHUR R. DAVIS, Assistant Professor of Chemistry; Massachusetts Institute of Technology.

This book has been completely rearranged. Specific new exercises and discussions which have been introduced include such topics as: the determinations of vapor density and molecular weight, the standardization of acids and the titration of acids and bases, Faraday's law, and the use of the pH scale of hydrogen ion concentration. A complete list of apparatus and chemicals required in the course has been added.

Ready August 1st
Approximately 352 pages; 6 by 9; Probable price, $3.00

ELEMENTARY QUANTITATIVE ANALYSIS

Second Edition

By CARL J. ENGELDER, Ph.D.

The treatment of volumetric analysis now precedes that of gravimetric analysis. However, the material is so arranged that the latter may be introduced first, if preferred. New material includes: analysis of hydrogen peroxide and of pyrolusite; determination of the available chlorine in bleaching powder, by both a direct and an indirect iodometric method; a short note on the use of ceric sulfate, and a complete analysis of both brass and limestone. New problems have been substituted.

Ready in June
Approximately 266 pages; 6 by 9; Probable price, $2.75

PRINCIPLES OF STRUCTURAL GEOLOGY

Second Edition

By CHARLES M. NEVIN, Professor of Geology, Cornell University.

This edition represents no departure from the former method of treatment, and the book is still primarily for beginning students. During the past five years, intensive research and field work have thrown so much light on the problems of structural geology that thorough revision of the first edition has been necessary in many places. Because of numerous requests, a new chapter, "Structures Associated with Igneous Intrusion," written by Dr. Evans B. Mayo, has been added.

Ready in July
Approximately 387 pages; 6 by 9; Probable price, $3.50

FORTHCOMING WILEY BOOKS

New Books—New Editions

A TEXTBOOK OF ILLUMINATION

Second Edition

By WILLIAM KUNERTH, Associate Professor of Physics, Iowa State College.

In this second revised edition the size and general plan of the book have been left as they were. The changes made consist especially of substituting up-to-date material for the obsolete and in adding about ninety per cent more problems, as well as revising the old ones. At the end of every chapter a list of additional references has been inserted, which makes it possible to extend the course if desired. The book is designed as a textbook in illumination for undergraduate students.

Ready August 1st

Approximately 272 pages; 6 by 9; Probable price, $3.00

DIFFERENTIAL EQUATIONS IN APPLIED CHEMISTRY

Second Edition

By FRANK LAUREN HITCHCOCK, Professor of Mathematics, and CLARK SHOVE ROBINSON, Associate Professor of Chemical Engineering; both at Massachusetts Institute of Technology.

This up-to-date second edition includes a revision and enlargement of the problem lists. The explanation of the use of Fourier's series has been made much more detailed, and a new chapter has been added presenting a simplified and abridged explanation of the numerical solution of differential equations recently devised by W. E. Milne and L. R. Ford.

Ready in June

Approximately 112 pages; 5 by 7½; Probable price, $1.50

THE CHEMISTRY OF THE COLLOIDAL STATE

Second Edition

By JOHN C. WARE, Ph.D., Consulting Chemist; formerly Associate Professor of Chemistry, New York University.

Among the new features appearing in this second edition are: Practical applications of the colloidal state have been interwoven with the theoretical material; adsorption now occupies an entire chapter; a section on electrokinetic potential has been added; the latest data on the precipitation of colloids have been included, and a new chapter has been added on intermediate cases and soaps.

Ready in June

Approximately 330 pages; 6 by 9; Probable price, $3.75

INDUSTRIAL CHEMICAL CALCULATIONS

Second Edition

By O. A. HOUGEN, Associate Professor of Chemical Engineering, University of Wisconsin, and K. M. WATSON, Universal Oil Products Co.

Extensive changes have been made to bring this book up to date. Emphasis is placed on the thermodynamic aspect of the subject. The first nine chapters deal only with the treatment of ideal low-pressure systems in which simple algebraic methods can be used; the last five chapters treat non-ideal cases by more general and complicated methods involving considerable use of the calculus.

Ready in July

Approximately 532 pages; 6 by 9; Probable price, $4.50

designed for a particular purpose

When you need optics for a particular purpose be sure to consult B & L about them. In the complete line of B & L Optics you will find those best suited to your needs.

One example of this is B & L Ultra Violet Optics which give 12% to 19% greater resolution in photomicrography by utilizing the short wavelengths of the Ultra Violet.

The U. V. Optics (16mm .25 N.A., 6mm .65 N.A., and 1.7mm 1.30 N.A.) are corrected to focus both 365 μm ultra violet and 546 μm mercury green at the same point. Focusing, therefore, is visible and positive and the exposure is made using the ultra violet.

Information on B & L Optics will gladly be sent on request. Write to Bausch & Lomb Optical Co., 642 St. Paul Street, Rochester, N. Y.

Bausch & Lomb
A CONVENIENT RESISTANCE FOR DETERMINATION OF REDOX POTENTIALS IN BIOLOGICAL FLUIDS

A discouraging source of error in the measurement of redox potentials in many biological fluids is the rapid polarization of the cell. The obvious remedy, high resistance in the galvanometer circuit, has been adopted in most laboratories. Many of these devices are inconvenient to manipulate or to assemble. The writer has found that a series of radio grid leaks (or resistors) connected to a multiple point switch allowed a rapid adjustment of the potentiometer with a minimum flow of current from the cell. The device, Fig. 1, was made for $4.00.

FIG. 1. Variable resistance for measurement of redox potentials of biological fluids. Unit resistance values above are in terms of $10^6$ ohms.

The variable resistance is placed in series in the galvanometer circuit. About 500,000 ohms are switched into the circuit. This resistance is cut down step by step until a galvanometer deflection can just be detected. The potentiometer is balanced and the process repeated step by step until the system is balanced with all the resistance cut out. Thus the minimum current necessary to deflect a galvanometer (sens. .018 microamperes) is drawn from the cell and polarization minimized. The values of the unit resistors need not be accurately known, since they are not concerned in the final measurement.

THE IDENTITY THEORY
By
Blamey Stevens

The author claims to have discovered a new theory opposed to that of Relativity. The fundamental postulate of his theory is that Space and Time are identical entities, differing only in the number of dimensions into which they are divided. He points out that the constancy of the velocity of light follows directly from this fundamental postulate, whereas in the Relativity Theory the fundamental postulate of a space-time continuum does not, of itself, lead to such a conclusion. It is then shown that the electro-magnetic field equations comply with the identity postulate and finally that the gravity field is indirectly explained by it, thus covering all field phenomena. A considerable part of the text is free from mathematics.

An Improved Indicator
for Vitamin C Titrations

Chemical methods of analysis as compared with animal assays for the determination of vitamin C have the advantage of greater speed and convenience without loss of accuracy. The method employed by Bessey and King, using 2,6-dichlorophenol-indophenol, has proved very popular because of the ease of manipulation. Improved accuracy in this test is now made possible with the purified indicator recently perfected.

This purified indicator, listed in Eastman Organic Chemicals, List No. 27, as P 3463 Sodium 2,6-Dichlorobenzenoneindophenol, is supplied at the same price that prevailed for the older reagent—1 g., $1.00. It is available for immediate shipment. Eastman Kodak Company, Chemical Sales Division, Rochester, N. Y.

EASTMAN ORGANIC CHEMICALS.

Realizing the importance of original investigations in the field of nutrition, Mead Johnson & Company are constantly enlarging their research department. The results have far surpassed expectations, not only because of the advantages accruing to the Company, but in contributions to pure science that have been made. Numerous materials previously unobtainable have been made available to scientists at a price only slightly above actual cost. It is a matter of much satisfaction that, without profit,

Mead Johnson and Company is able to offer assistance to fellow investigators.
