Consider These Textbooks

Marshall’s Anatomy

Just Ready—Brand New (2nd) Edition—All of the distinguishing characteristics of the first edition of this text are retained in the revised New (2nd) Edition. Dr. Marshall’s aim is to make the student think of anatomy in relation to life. This text is in reality a functional anatomy because, in addition to describing the fundamental facts of the forms and structures of the human body, it brings out the relationship of one part of the body to another and to the body as a whole.

By CLYDE MARSHALL, M.D., Department of Anatomy, Yale University. 385 pages, 257 illustrations.

Crandall’s Physiology

Second Edition—Elementary human physiology is here presented in a manner especially suited to modern educational needs. The author clearly stresses those things the student must know about body function and their application to health and disease. 104 diagrammatic illustrations are used to make plain intricate processes.

By LATHAM A. CRANDALL, JR., M.D., Ph.D., Associate Professor of Physiology and Pharmacology, Northwestern University Medical School. 356 pages, 104 diagrammatic illustrations. Cloth, $2.00 net.

Stiles’ Physiology

Just Ready—New (8th) Edition. Professor Gordon C. King of Ohio State University has revised this widely used text on Human Physiology. As in previous editions, homely similes and many practical teaching devices are used to impress upon the student the meaning of the physiologic actions of the body. Hygiene is brought into the discussion in many places in order to correlate the essentials of this subject with physiology.

By PERCY GOLDSWORTHY STILES. Revised by GORDON C. KING, Assistant Professor of Physiology, Ohio State University. 448 pages, illustrated.

Harrow’s Biochemistry

New Book—The principles of biochemistry are here correlated into a systematic text that is proving particularly satisfactory in actual classroom work. Special emphasis is placed on the application of the facts. The clear explanations of scientific aspects and technical terms are designed to facilitate student understanding.

By BENJAMIN HARROW, Ph.D., Professor of Chemistry, City College, College of the City of New York. 383 pages, illustrated. Cloth, $3.75 net.

King & Roser’s Anatomy and Physiology Laboratory Manual and Study Guide

Just Ready—New Book. This new book is both a laboratory manual and a work book. It is designed for use with any standard text. The authors have arranged the material in a flexible manner in order to comply with individual needs and preferences. The illustrations are excellent and questions for review are included.

By BARRY GRIFFITH KING, Ph.D., and HELEN MARIA ROSEY, B.A., R.N.; College of Physicians and Surgeons, Columbia University. 270 pages, illustrated.

BASIC METHODS FOR EXPERIMENTS ON EGGS OF MARINE ANIMALS
89 Pages. Washable Fabric $1.25

This book presents fundamental methods for the experimental investigation of eggs and spermatozoa of marine invertebrates. General rules are given for the use of beginners in experimental embryology and as a basis for the specialist whose work demands individual extension of methods. A large section of the book is devoted to methods for the preparation of the fixed egg.

THE BIOLOGY OF THE CELL SURFACE
42 Illustrations (116 Figures) some in Colors. Bibliography. Washable Fabric $5.50

The structure and function of ectoplasm are treated in detail in this book for upon these rests the author's theory of the state of being alive. Problems of animal development are exposed, defined and related to the activity of the cell surface.

VOLT-OHM-MILLIAMMETER

A Single Instrument with Twelve Long-Clear-Independent Scales

marked in the units you want to read

An exceedingly versatile combination electrical measuring instrument suitable for making nearly all of the electrical measurements required in ordinary educational or industrial work. An outstanding feature is the lack of confusion in reading the meter scale, which is frequently encountered with multiple scale instruments. There are 12 different, independent, single range scales on this meter, but only one is exposed beneath the meter pointer at a time, thus providing the simplicity of a single range instrument for each of 12 types of measurements. The 12 scales are engraved on a cylinder which rotates with the turning of the selector switch to the desired setting. The selector switch selects the corresponding multiplier, shunt or bridge circuit for the scale exposed.

Four scales are provided for direct current measurements between 0 and 1 ma., 0 and 10 ma., 0 and 1000 ma., and 0 and 3 amperes with an accuracy of 2% of full scale deflection. There are 4 scales for direct current voltages between 0 and 2 volts, 0 and 10 volts, 0 and 150 volts, and 0 and 1000 volts with an accuracy of 2% of full scale deflection. Resistance measurements may be made from 3 scales with ranges from 0 to 100 ohms, 0 to 50,000 ohms, and 0 to 2 megohms. One scale is provided for alternating current voltages between 0 and 250 volts with an accuracy of 5% of full scale deflection. Batteries are provided within the case to supply current for the resistance bridge circuit.

THREE NEW
ELECTRIC INTERVAL TIMERS
WITH SELF-STARTING, SINGLE-PHASE SYNCHRONOUS MOTOR

8073-A. Interval Timer, Electric, motor driven, for actuating Time Markers such as No. 8060, etc., listed on page 633 of our catalogue. Consisting of a self-starting, single-phase synchronous electric motor mounted on iron base 3 x 5 inches. The motor operates a notched wheel which, in turn, actuates a spring lever making contact every 1 second. With connecting cord, switch and plug. For use on 110 volts, 60 cycles a.c. Code Word Memdn

8073-B. Ditto, but with contact interval of ½ second Code Word Memel

8074. Interval Timer, Electric, motor driven, for actuating Time Markers such as No. 8060, etc., at intervals of ¼, 1, 3 or 6 seconds as desired. Consisting of a self-starting, single-phase synchronous electric motor mounted on iron base 4½ inches square. The motor operates four notched wheels which, in turn, actuate the arm making contacts. With connecting cord, switch and plug. For use on 110 volts, 60 cycles a.c. Code Word Memgh

GRAPHIC ELECTRIC TIME MARKER

8039-C. Time Marker, Graphic, Electric, motor-driven, for use directly on the drum by connection with lighting circuit. Of sturdy construction. Consisting of a self-starting, single-phase synchronous electric motor mounted, with writing stylus, on an extension rod. The motor operates notched wheels which, in turn, actuate a writing lever. Time can be recorded in intervals of ½ second or 1 second. Overall length, 9 inches. Complete with connecting cord, switch and plug. For use on 110 volts, 60 cycles, a.c. Code Word Mawud

NOTE—Any of the above Timers can be furnished on special order to operate on 50 or 25 cycles, 110-volt current; or on 60, 50, and 25 cycles, 220-volt current.

Because of its unusual versatility, the Heyrovsky Micro Polarograph has penetrated a great variety of fields. It has brought to innumerable laboratories the possibility for performing many new procedures formerly impossible because of limited facilities. The Polarograph also has permitted the complete revision of many older methods by eliminating time consuming chemical operations and variables due to personal technique. These new improved methods are consequently much faster and in many instances much more accurate.

Since the introduction of the Polarograph a large volume of literature has been published. A complete bibliography of more than 400 papers will be mailed on request. During the past year a considerable amount of research has been done with the Polarograph, and a few of the most interesting publications follow:

A publication completely illustrating and describing the Model X Heyrovsky Micro Polarograph will be sent on request.

Universal visual photometer of highest precision for absolute colorimetry (modulus of extinction), measurement of hydrogen ion concentration, nephelometry and luminometry (intensity determination of fluorescence effects). The range of this equipment extends into the measurement of extremely low intensities (tyndallometry) where photo-electric methods fail.

CHIEF FEATURES

No adjustment of lamp due to special method of light transmission. Extremely accurate and reliable method of varying intensity in the comparison field.

Detection of lowest and highest modulus of extinction with special chambers. (0.01 mm. to 15 cm. working depth).

Strictly monochromatic filters used. Monochromator adaptable for extreme precision.

Rapid change-over for nephelometry, densitometry, lustre and color analyses.

Stand—rigid, stable, and well balanced. Smooth and positive coarse adjustment. Ball-bearing fine adjustment ceases action upon touching cover glass. Dustproof nose-piece and objectives permanently centered and designed for maximum definition, resolution and color correction. Available with either Achromatic, Fluorite, or Apochromatic Objectives. Cone type eyepieces with high eyepoint, a feature valuable to wearers of glasses. Integral mechanical stage with long range. Rack and pinion substage, 1.5 Abbe condenser.

Illustrated above—B&L Microscope DDE a complete research model for the most critical work.

His Choice WILL ALWAYS BE A B&L MICROSCOPE

He is dealing with an exact science, demanding the utmost in accuracy and precision. His instruments must meet these needs. That's why you will find B&L Microscopes in use in laboratories throughout the world.

Mechanically and optically, from stand to objectives, each B&L Microscope is designed and built to the highest standards. Whether the microscope is used visually or for photomicrography, the user is certain of the satisfaction that comes from work accurately done. As the demands of his work increase or as new methods of procedure are developed his B&L Microscope can always be adapted, through available accessories, to a broader field of usefulness.

Now to use the device the wire ring is simply dipped into water momentarily and a film of liquid imprisoned across the ring. The animal is then placed in this film and is automatically retained therein by the action of the surface tension on the two sides. The lead weight serves to hold the ring on the stage of the compound or dissecting microscope in any position desired.

The device has the advantage of confining the animal to a small area and, essentially, to a single plane so as to eliminate the necessity of continual change of focus. The animals so far studied by this method show surprisingly little tendency to struggle, but, to the contrary, go about their feeding and regular body movements within the fluid layer in what appears to be a normal manner. Furthermore, the large area for gaseous diffusion eliminates any respiratory difficulties.

The method has proved of exceptional value in studying mosquito larvae and their relations to the surface, but, presumably, is to be recommended for vital preparations of other aquatic invertebrates. The films last for considerable lengths of time, depending, of course, upon the relative humidity of the laboratory air. A number of them were timed at over an hour. Loss of thickness due to evaporation, however, may be readily remedied from time to time by addition of a drop of water to the film without disturbing the preparation.

The film may be varied in thickness to accommodate animals of different sizes by adding more or less water with an eye-dropper or by using various sizes of wire in the loop.

A further advantage is the ability thus offered to study the ventral side of the animal by simply turning the lead block over on its other end.

A PRACTICAL OPERATING STAND

The operating stand described herewith was especially constructed for use in experimental surgery. The advantages of this type of stand are: (1) Low cost and ease of construction. (2) Interchangeable operating table tops for various sizes of animals. (3) The operating table top may be tilted through 180 degrees. (4) The operating table top may be rotated through 360 degrees. (5) The operating table top may be elevated from 29 inches to 45 inches allowing a sitting or standing operating position. (6) The single column allows maximum leg room and the entire stand occupies little laboratory space.

The entire column (1) is constructed of pipe and pipe rail fittings. A is a 2-inch pipe rail base, B is a piece of 2-inch pipe 20 inches long drilled and tapped at C for the locking bolt, D is a piece of 13-inch pipe 20 inches long and E is a 14-inch pipe rail adjustable base. The brace F and H is of strap iron and is attached to the operating table top by means of an awning bracket G.

The operating table top is of the size that will accommodate the animal being studied and is made mainly of wood, held together by strap iron. The cross sec-

A New Book of Outstanding Importance

A GERMAN-ENGLISH SCIENCE DICTIONARY

By Louis DeVries
Professor and Head of Modern Languages,
Iowa State College

473 pages, 5x7, flexible binding. $3.00

Intended for the use of students in the agricultural, biological, and physical sciences, this unique dictionary contains 48,000 terms (German-English) pertaining to bacteriology; botany and zoology, including anatomy, embryology, pathology, and physiology; entomology; genetics; horticulture; agronomy; chemistry; physics; and mathematics.

This dictionary, prepared in collaboration with the author's colleagues in the various science departments of Iowa State College, is the first to combine fully the agricultural and biological terms with those of the physical sciences.

Of exceptional interest is the inclusion of a large number of literary terms needed by the student in science.

Many common idioms are included, and past tenses and past participles are translated, making the dictionary unusually helpful either to advanced or elementary students.
