NAVIGATION

By Lyman M. Kells, Willis F. Kern and James R. Bland
United States Naval Academy

580 pages, 6 x 9, illustrated. Textbook edition. $3.75

This important new text is also available in two separately published volumes:

Part I. Coastal and Inland Waterways Piloting. 288 pages, 6 x 9, illustrated. Textbook edition. $2.50

Part II. Celestial Navigation and Nautical Astronomy. Approximately 200 pages, 6 x 9, illustrated. Textbook edition. $2.00

Navigation presents a complete course in the subject, dealing with the best and the latest methods used in navigation practice. An outstanding feature of the text is simplicity obtained by logical arrangement of material and careful preparation for each development. Basic review material on mathematics has been selected so that the student will gain from it needed mathematical power while becoming familiar with essential concepts and procedures of navigation. Nevertheless, each navigational theory is given a thorough independent treatment. Illustrative examples, together with numerous figures and diagrams, are used to bring out all essential elements of a topic. Graded exercises follow each topic.

Chapter Headings

Fundamental Mathematics for Pilots
Instruments
Charts
Piloting
Navigation Aids, Rules of the Road, Tides and Currents
Ship and Plane Maneuvers
Review of Spherical Trigonometry
Sailings and Nautical Astronomy

PLANT TUMOR BACTERIA

TUMORS on plants, that are very much like animal tumors, even to the formation of cancerous dead areas within themselves and eventually killing the plants, are being studied by Dr. Philip R. White at the laboratories of the Rockefeller Institute for Medical Research at Princeton, N. J. They are unlike animal tumors in that they are started by easily detected bacteria, but they are like animal tumors in that they can be transplanted into previously healthy tissue—and these transplants do not need to have the originally causative bacteria in them to continue their malignant growth.

Dr. White’s latest efforts have been in the direction of finding how these bacteria operate to start the tumorous growth. He has not got the whole answer yet, but he is able to report one or two interesting leads.

One thing he has discovered is that the bacteria can be robbed of their tumor-causing power by growing them on nutrient media containing the protein fraction known as glyeline. Bacteria thus treated can live in the tissues of the host plant, but tumors do not develop at the point of inoculation. However, if the top of the plant is cut off, and the tissues around the infected spot are treated with a solution of one of the growth-promoting substances or hormones, tumors again develop, although bacteria taken from these new tumors are still unable to produce new tumors elsewhere unless they are again aided by growth-promoting hormones. But if bits of germ-free tumors are transplanted into healthy plants, they will develop into big and harmful growths. That is, even though the bacteria have been rendered harmless by themselves, they are still capable of being links in a chain of harmful development, that can go on afterwards by itself without them. As Dr. White phrases it, the plant’s cells have undergone a ‘permanent and irreversible cancerization.’

Another lead followed by Dr. White has been the suggestion that the bacteria themselves are not the cause of the mischief, but that they act as carriers of a virus, much as mosquitoes serve as carriers of the yellow fever virus. The hypothetical viral tumor, it was suggested, might then carry on in the plant tissues without further help from the bacteria.

To test this, Dr. White sought a plant species that could survive a degree of heat that is sufficient to kill known plant viruses. Such a species was not easy to find, but he located one finally, a garden flower known as the Madagascar periwinkle. This delicate-looking but really tough little plant can survive prolonged exposure to a temperature of 115 degrees Fahrenheit.

Inoculated with the tumor bacteria and held at this temperature for ten days, nothing happened; but when the temperature was lowered to an ordinary greenhouse level the tumors developed normally. In the meantime the bacteria themselves had disappeared—but before they died they managed somehow to bequeath to the plant tissues a heritage of abnormal growth.

ALLERGY AND APPENDICITIS

APPENDICITIS may be due to allergic reactions similar to those causing the symptoms of hay fever, asthma and the like, is reported by Dr. L. O. Dutton, of El Paso, Texas, in the forthcoming issue of a new medical journal, the Annals of Allergy. This bi-monthly journal, published at St. Paul, Minn., is the official organ of the newly organized American College of Allergists. This new scientific body aims, among other things, to bridge the gap between doctors specializing in treatment of allergy, the many other practicing physicians ‘‘who are applying allergy to their practice,’’ and the non-clinical scientists such as biochemists, pharmacologists, botanists and plant pathologists who contribute to knowledge of allergy and its management.

The theory that appendicitis is due to allergy does not, Dr. Dutton emphatically states, contradict the fact that it must be treated by surgery. Prompt diagnosis and prompt operation to remove the infamed appendix before it ruptures and causes death-dealing peritonitis is required, regardless of whether or not the appendicitis was caused by allergy. The allergic theory, however, if proved valid and sound, ‘‘offers some hope of prophylaxis.’’

Scientists have never agreed on one single cause for appendicitis, he points out. In some cases the cause is mechanical obstruction due to fecaliths, kinks or adhesive bands. Functional obstruction due to swelling is supposed to occur frequently. Such swelling and engorgement of the appendix tissue is similar, Dr. Dutton points out, to the swelling which characterizes allergy in other conditions as, for example, hay fever. Careful study of over 120 cases of appendicitis and the appendices removed at operation strengthened Dr. Dutton in this theory which previous experience had suggested.

In 87 of these patients, moreover, 45, or more than 50 per cent., gave a history of definite hay fever, asthma or hives existing before the appendicitis attack. Although based on too few cases to be statistically reliable, Dr. Dutton says, the figures are nevertheless impressive in contrast with the fact that these three allergic conditions occur in less than 10 per cent. of the general population.

THE NEW MEXICAN VOLCANO

SCIENTISTS are not able to predict as yet when the new Mexican volcano, Paricutin, will stop erupting, was reported by Ralph R. Bodle, seismologist of the U. S. Coast and Geodetic Survey, who has made an inspection of the volcano.

Mr. Bodle met a native who was helping to evacuate the people of the little town of Paricutin partially covered by lava from the volcano. ‘‘Many learned people come here to study the volcano,’’ said the native. ‘‘They write articles but with all their knowledge not one can tell you when the volcano is going to stop.’’

The government seismologist was on the spot to watch when the volcano let loose a new flood of lava in mid-June. The new phase of activity was ushered in by a

Ready Summer—Fall

GENERAL PHYSICS: A Textbook for Colleges
By OSWALD H. BLACKWOOD, Professor of Physics, University of Pittsburgh.
A textbook for the standard course in general physics for college students. Its content represents an amplification of the author’s earlier book “Introductory College Physics.” “General Physics” follows the same general structure as the older book, but the material is more comprehensive and more difficult. Simplicity of presentation, however, has been maintained, together with appropriate rigor.
Approx. 598 pages; 6 by 9; Probable price, $3.75

ELEMENTARY QUALITATIVE ANALYSIS
By BRUCE E. HARTSUCH, Associate Professor of Chemistry, Michigan State College.
The subject matter of this book is suitable for use in beginning courses in qualitative analysis. The material is written in a readable and understandable style, with detailed, step-by-step solutions of illustrative problems. Laboratory directions are included. The discussions are keyed to the level of the student’s understanding.
Approx. 294 pages; 7½ by 10¼ ; Probable price, $2.50

STATISTICAL ADJUSTMENT OF DATA
By W. EDWARDS DEMING, Head Mathematician, Bureau of the Census.
A practical textbook in statistical adjustment. Different kinds of problems are unified and brought under one general principle and solution—statistical procedures associated with curve fitting and other adjustments by least squares and skeleton table forms for numerical calculations. Suitable for courses in graduate chemistry, physics, sociology, agriculture, or biology.
Approx. 248 pages; 5½ by 8 ; Probable price, $3.50

PATHOLOGY IN FOREST PRACTICE
By DOW V. BAXTER, Assistant Professor of Silvis and Forest Pathology, University of Michigan.
An eminently practical treatment of the subject of forest pathology, designed to provide a working knowledge of the conditions which cause disease and of the practical measures which can be taken to reduce its incidence or its severity. The whole subject of pathology is presented from the “crop” or “purposeful” point of view, and so is integrated with other branches of forestry.
Approx. 596 pages; 6 by 9; Probable price, $4.75

INTERMEDIATE DIFFERENTIAL EQUATIONS
By EARL D. RAINVILLE, Assistant Professor of Engineering Mathematics, University of Michigan.
This book is designed for use in a course to follow the usual one in elementary differential equations. Emphasis is placed upon development of the student’s technique. The book trains the student in the construction of computable solutions for specific differential equations. Applications to engineering problems are given. An introduction is offered to several topics of importance in the classical theory.
Approx. 221 pages; 5½ by 8½; probable price, $2.75

JOHN WILEY & SONS, Inc., 440-4th AVE., NEW YORK 16
strong earthquake motion that shook the whole country-side. The cone itself was obscured by a great cloud of dust. Then a third to a quarter of the cone collapsed due to lava forcing its way out under one side of the base. The lava flow continued for about ten days until it reached the village.

Mr. Bodle's studies show that earth shocks at the city of Uruapan about 15 miles distant from the volcano were almost continuous for some 20 days before the volcano began to form in a corn field on February 20. Some strong shocks that were felt on February 22, he believes, were due not to the volcano but to a large earthquake centering off the west coast of Mexico. Shocks were felt throughout the immediate region of the volcano for some days after the lava appeared.

Strangely enough, the shocks continued in one locality about five miles southwest of the volcano long after they had died out elsewhere. At this place, known as Pechu, in the foothills of Tancitaro mountain, the shocks continued until about May 7, when they nearly ceased. A field party surveying the earth's magnetism near the volcano under the direction of Nelson C. Steenland, of the U. S. Coast and Geodetic Survey, camped there on May 21 and felt three shocks which appeared to be related to explosions in the crater of the volcano.

In his exploration of the volcano Mr. Bodle noticed that the sand was hot at one place. Three or four days later a lava field had covered the site of his observations. This caused him to credit the story heard in Mexico that the volcano appeared, an Indian in whose field it started found that the ground was warm and went out there to sleep to ward off the chill of night air.

THE MEDITERRANEAN FISHING INDUSTRY

Sardinia's sardines, for the past two decades or so, have been consumed mostly in Italy. Small quantities were still being imported into America before the war to satisfy the taste of Italian-Americans who have a particular liking for this especially cured and packed-in-olive-oil little fish. The commercial sardines used in America come from the Atlantic and Pacific coasts, and are packed principally in Maine and California. Some have been imported from Norway, France and Portugal.

During the past year or so, fishing in the Mediterranean has practically ceased. Sicily and other Mediterranean islands and countries caught, packed and shipped much tuna, or tuna, in pre-war days. The Tunisia campaign brought this activity to a standstill. Other fish is more or less plentiful in the Mediterranean. With the collapse of Italy's war resistance, the industry may start again. Much food could be obtained from this great body of water.

Except for local consumption, commercial fishing was never a great industry in the Mediterranean. Pre-war Italy, including Sardinia, Sicily and a number of the smaller islands, landed about 50,000 to 60,000 tons a year. Northern African fishermen together slightly exceeded Italy's catch. Eastern Mediterranean Asiatic countries caught a few thousand tons. Data for Greece and other European nations are not available, but their catches were small and used only locally.

France and Spain carry heavy fishing activities. Together they landed nearly $88,000,000 worth of sea products a year, but only a small part of this was from Mediterranean waters. These figures do not add up to big business as do fishing figures in America.

There are possibilities, however. With the food shortage in all the Mediterranean countries that have been occupied by the Nazis, the fishing industry could be expanded far beyond its past extent. Modern methods would have to be introduced. The industry could well be assisted by the United Nations in order to save long hauls of other foods to relieve the underfed Mediterranean people.

ITEMS

A FAVORITE Mexican resort city for American tourists is adding science and culture to its attractions. Just a block north of Ambassador Morrow Street, named for the U. S. Ambassador who had a home in Cuernavaca, there is now a street that bears the name of the honorary president of the Mexican Academy of Sciences, Engineer Agustín Aragon y Leon. This honor to one of Mexico's leading scientists, born seventy-three years ago in the state of Morolos of which Cuernavaca is the capital, is considered but part of a movement toward greater appreciation of science in this important region of Mexico. Governor Jesus Castillo Lopez has already announced his support of a Mexican Council of Learned Societies and he has invited the Mexican mathematicians to hold their second convention in Cuernavaca next May. Engineer Aragon, for whom the street was named, was a member of the geodetic commission that set the border between the United States and Mexico. His career has been devoted to science, mathematics and philosophy as well as engineering.

MUSCLE tissue of a warm-blooded animal has been studied and photographed under the electron microscope, to disclose details of structure hitherto unknown, or at best inferred from indirect studies with x-rays and other means. This work, done at the Swedish Royal Academy of Sciences in Stockholm, is reported in a recent issue of the British journal, Nature, just received here, by Professor Fritiof Sjöstrand. Late in 1942, a group of investigators in Philadelphia reported electron microscope studies on muscle fiber, but this was the muscle of a cockroach. It is believed that the present Swedish research is the first carried out on a warm-blooded vertebrate. A guinea-pig supplied the muscle sample. Since the streams of electrons that are used instead of light rays in the electron microscope must pass right through the specimen, the muscle had to be sliced exceedingly thin. By a technique combining freezing and drying, Professor Sjöstrand was able to prepare sections that in places were only 20 millimicrons thick. A millimicron is a millionth of a millimeter or a twenty-five-millionth of an inch, so the areas shown in the photographs were slightly less than a millionth of an inch in thickness.
A complete line for clinical laboratories devoted to all branches of chemistry, bacteriology, hematology, and parasitology. Tested and checked in our own clinical laboratories. Purity warranted. Our facilities assure prompt shipment of large or small orders. Inquiries invited.

NEW CATALOG
Reagents catalogued alphabetically—also according to subjects and techniques, plus medical reference guide. Catalog comprises full line blood testing sera including anti-Rh, anti-M and anti-N; also reagents for Wassermann, Kline, and Kahn tests. Write for your copy. FREE ON REQUEST.

PHOTOVOLT ELECTRONIC PHOTOMETER

A highly sensitive light meter with phototube and DC amplifier
- Obtainable with phototubes having main response in the ultraviolet, visible, infrared.
- For measuring low light values, ultraviolet emission and absorption, infrared reflection, goniophotometry, micro-colorimetry, fluorescence, luminescence of paints.
- Suited for spectrophotometry, densitometry of spectrographs, exposure determination by focal plane readings in photomicrography.

PHOTOVOLT CORP. New York City

LaMotte Roulette Comparator
(Standard Type)

This model was especially designed for accuracy in making pH determinations. The LaMotte Permanent Color Standards are contained in a revolving drum—always in place—permitting immediate pH determinations, with simplicity, and convenience. The set is portable, operating from any light socket. Highly recommended for research and special control work. Range, any three sets of standards in intervals of 0.2 pH. Accuracy 0.1 pH. Complete, f. o. b. our laboratories, $75.00.

Accuracy that Counts on all Fronts

At first glance there would seem to be little relationship between an intricate, ten-foot long height finder and a microscope objective with lenses of less than one millimeter in radius. Yet both are the products of the same eyes, the same facilities, the same standards of accuracy, the same experience. Both are aiding in America’s war effort. Both are products of Bausch & Lomb.

The lens computing and grinding skills that for years have produced the minute, exceedingly accurate lens components of the microscope objective are today also being employed in the production of height-finders and gunfire control instruments that are helping America’s armed forces to win an earlier Victory.

This quantity production of precision optical instruments, pioneered and fostered by Bausch & Lomb through years of peace, has become a highly valued asset to an America at war. Here again, because of its wartime accomplishments, Bausch & Lomb will be able to extend its optical services to peacetime pursuits when Victory is won.

BAUSCH & LOMB
OPTICAL CO. • ROCHESTER, N.Y.
ESTABLISHED 1853

For Bausch & Lomb Instruments essential to Victory—priorities govern delivery schedules.
"WRATTEN LIGHT FILTERS"

A Book of Data on Wratten Filters

There are more than 100 filters in the series of Wratten light filters. They are designed for use in general monochrome and color still photography, cinemato-graphy, and special scientific fields—including astronomy, photometry, spectroscopy.

Each Wratten Filter is made to meet a rigid standard, and is supplied in the form most convenient for its application.

The purpose of the book, *Wratten Light Filters*, is to facilitate selection of filters by providing complete spectrophotometric data concerning them.

The 88-page Sixteenth Edition of this publication gives transmission curves and tables for all filters, as well as notes on the use of filters for special purposes. It is available at dealers in photographic supplies.

SAVE MAN POWER in Every Department with

APeCO Photocopy MACHINE

APeCO Eases Man-Power Shortage. It saves valuable time now spent on tracing, typing, and copying—releasing Men, Women and their equipment for other work.

APeCO makes photocopies up to 18 x 22"—1st copy in 3 minutes—120 copies an hour. No chance for error! No need for proofreading! Accepted in law, government, and engineering. Used by leaders throughout industry. Foolproof operation! Sturdy Construction!

ANYONE - ANYTIME - CAN MAKE PHOTO-EXACT COPIES OF ANYTHING WRITTEN, PRINTED, DRAWN OR PHOTOGRAPHED

With our simple instructions any inexperienced girl or boy can produce permanent, photo-exact copies at any desk or table. No special skill or dark-room needed.

Prompt delivery on machines and supplies. Write for FREE folder now! A demonstration in your own plant or office will surprise you how easily APeCO makes perfect copies. Without obligation, ask to have an APeCO Consultant call—located in all principal cities and Canada.

The Greatest Health Crusade in History

Health is the first prerequisite of a soldier. Keeping him healthy is an essential ingredient of Victory.

Since World War I medical science has crusaded relentlessly for greater knowledge to insure better health. The success of this crusade is resulting in an army which is far healthier than any in history. Of equal importance is the fact that the nation behind our armed forces is likewise one of the healthiest which the world has ever known.

Today, as for over a century, Spencer Microscopes are playing an important role in both medical progress and applied medical practice. Greatly increased production facilities are in operation night and day to meet the unprecedented wartime needs for microscopes.

Optical instruments are so vital to war and public health that the nation's needs absorb practically all of Spencer’s greatly increased production.
