Pre-medical texts

**Blakiston Books**

**BREMER**

**Textbook of Histology—5th Edition**
This famous text is noteworthy for its clearness and readability, also for the quality and abundance of its illustrations. Emphasis is given to normal functional changes in the cells and to their activities in the living state. By J. L. Bremer, Harvard Medical School. 455 Illus. 580 Pages. $6.50

**LAMBERT**

**Introduction and Guide to the Study of Histology**
The objective is to impart a knowledge of the subject as a foundation for the further study of physiology and pathology. Comprehensive directions for laboratory study are included. By A. E. Lambert, School of Medicine, State University of Iowa. 198 Illus. 542 Pages. $5.00

**NEAL and RAND**

**Comparative Anatomy**
In this book the facts are given interest and meaning in terms of human phylogenesis. Descriptions are clear, and many well labeled figures are included. By H. V. Neal, Tufts College and H. W. Rand, Harvard University. 540 Illus. 739 Pages. $4.75

**Chordate Anatomy**
This text offers material for a sound morphological course with functional interpretations. 378 Illus. 467 Pages. $3.50

**COLIN**

**Elements of Genetics**
A modern, well integrated beginner’s text in genetics. It includes at the end of each chapter a list of carefully graded problems. By E. C. Colin, Chicago Teachers College. 47 Illus. 386 Pages. $3.00

**STILES**

**Handbook of Microscopic Characteristics of Tissues and Organs—2nd Edition**
It gives in outline form the main histological characteristics of vertebrate tissues and organs. It is an excellent guide to laboratory study. By K. A. Stiles, Coe College. Illustrated. 294 Pages. $1.50

**MARSHALL**

**Laboratory Guide in Elementary Bacteriology**
This manual presents 92 experiments grouped under Introductory Technique, Physiology of Bacteria, Applied Bacteriology, Serology and Infection. By M. S. Marshall, University of California. 244 Pages. $1.75

**PATTEN**

**Early Embryology of the Chick—3rd Edition**
A clear, brief presentation of basic facts for beginning students in embryology. By B. M. Patten, University of Michigan. 87 Illus. 226 Pages. $2.50

**Embryology of the Pig—2nd Edition**
The fundamental facts of mammalian embryology are clearly presented in this book. 168 Illus. 327 Pages. $3.00

The Blakiston Company, Philadelphia 5
RED STARS

A large number of red stars, of the peculiar M type are imbedded in atmospheres of titanium oxide gas, is reported by Dr. Oliver J. Lee, director of Dearborn Observatory of Northwestern University, who has studied the problem during the past twelve years with the assistance of Ralph B. Baldwin, David W. Hamlin, and Richard F. Kinnaird. Approximately 85 per cent. of these red stars listed in Volume V of the "Annals of Dearborn Observatory" are relatively faint and have not previously been analysed.

The M type stars are peculiar in that they are more numerous proportionally in the direction of the constellations Scorpio and Sagittarius, the center of our galactic system. This is in marked contrast to stars of the R and N type which are surrounded by an envelope of gaseous carbon, for they cluster notably in the opposite part of the sky in the direction of the constellation Orion.

Dr. Lee points out that "in view of the oft-repeated statement that a large proportion of advanced M stars are variable, it was reasonable to expect that a considerable number of new long-period variables would be found. We did not find half a dozen, although it would have been easy to detect a change of one or two magnitudes in brightness."

The study which Dr. Lee and his assistants have been making is hoped to throw light on the problem of how stars are born and what becomes of them when their internal energies have exhausted themselves. Observations of faint red stars will continue at Dearborn Observatory, and it is hoped eventually to complete a spectrographic survey of the whole sky, classifying all faint red stars up to a magnitude of 11.5.

RADIO STATION OF THE NATIONAL BUREAU OF STANDARDS

A new, more powerful radio station has been opened by the National Bureau of Standards in Washington. No one will be able to tune in for entertaining programs, however, for its broadcasts are limited to ticks, hums and whistles which set the frequency standards for technical men in many industries.

The service has now been extended so that good reception is possible throughout the United States, the North Atlantic Ocean and, with fair reception, over most of the world. Broadcasts will be continuous night and day on five, ten and fifteen thousand kilocycles.

The radio and audio frequencies serve as standards used by radio engineers of the armed forces, commercial stations and radio industry. It is by the National Bureau of Standards broadcasts that a station periodically checks to make sure that broadcasts are on the frequency prescribed by law and that the programs will come in where the listener expects them to be.

One of the audio frequencies used, 440 cycles per second, is the standard musical pitch corresponding to A above middle C. It is used by all musical instrument manufacturers, and many piano technicians and musicians. The broadcasts are helping to set up a uniform standard; for there has been some difference of opinion as to what the tone A really is.

Besides these frequencies there is a pulse every second heard as a faint tick when listening to the broadcast. These may be used as accurate time signals and their one-second spacing permits scientists to make accurate physical measurements.

Error of less than one part in 10,000,000 is the average accuracy standard maintained for all frequency broadcasts.

PROSPECTING FOR RADIIUM ORE

Prospecting for radium ore with an "electrical detective" has proved practicable and the instrument may be adapted for sorting and grading radioactive material after it is mined. A portable adaptation of the Geiger-Muller counter, an instrument ordinarily used in the laboratory to detect and count ionizing particles, has been designed for prospecting by Dr. G. L. Locher of the Bartol Research Foundation, Swoentieth, Pa.

It was turned over to G. Carman Ridland, formerly resident geologist for Bear Exploration and Radium, Ltd., in Canada, who gives the results of his work in a report to the American Institute of Mining and Metallurgical Engineers, as follows.

"The results obtained with the Geiger-Muller counter at Great Bear Lake demonstrate that the instrument can be of value in the search for radioactive ore." He believes that the counter is "not only adaptable to the detailed search for radioactive ore bodies in established radioactive territories, but could, and should, be used by prospectors and members of federal geological survey parties in their aerial reconnaissances of large, unexplored regions."

Mr. Ridland surveyed areas at Contact Lake in Canada where pitchblende veins, source of radium and uranium, had been encountered during silver mining. By detecting abnormally high numbers of gamma rays shooting from the rocks, Mr. Ridland found several areas which warranted definite exploration programs.

Each ray entering the counter is translated by the instrument into a click which the operator hears in earphones. Since the instrument is also sensitive to the cosmic rays reaching the earth from outer space, a correction must be made for the background of clicks heard due to the cosmic rays.

THE PRODUCTION OF SYNTHETIC RUBBER

Improved synthetic rubber production through use of an electronic "chemist" to analyze the complicated gases formed in making butadiene has been announced by Dr. John A. Hipple, physicist at the Westinghouse Research Laboratories, who in cooperation with technical men from the industries involved, adapted the instrument, called a mass spectrometer, for its new war job.
"In 15 minutes," Dr. Hipple explained, "this spectrometer will dissect a complicated gas molecule a twenty-five-millionth of an inch long and can be arranged to automatically produce an autograph that tells the chemist the composition of the gas. At present certain analyses require from 15 hours to three days of painstaking laboratory work by five to ten skilled chemists—others can not be done at all even by other processes. Results attained by these tedious methods are much less accurate than the molecular 'portrait' that comes out of the spectrometer."

As butadiene molecules are built up in the chemical plant, their composition must be checked at intervals to make sure the correct structure is being obtained. An error in molecular design would result in poor quality synthetic rubber.

Present methods are sometimes so slow that the batch of butadiene has gone through the various steps of processing before the check analysis is completed. Thus, under the old method, a batch of butadiene may have to be reprocessed, causing lost production time.

**TROPICAL PLANTS**

If you should get lost in the jungle, after a forced plane landing or a shipwreck, and have to live off the country while you find your way out, hunt for plants that look like the ones you knew back home. This is one hint offered for the benefit of "bushed" soldiers and sailors by Dr. E. D. Merrill, of Harvard University, administrator of its extensive plant collections, who spoke on August 14 over the Columbia Broadcasting System in Science Service's Adventures in Science program. Dr. Merrill is the author of the first government-sponsored manual on emergency foods, entitled "Emergency Food Plants and Poisonous Plants of the Islands of the Pacific."

"In the tropics, as elsewhere," stated Dr. Merrill, "one may eat all types of animals and birds that can be captured, including lizards, snakes, rodents, monkeys, bats, parrots and even locusts."

Dr. Merrill spoke from experience, for he has tried them all on occasion.

Certain natural groups of plants growing both in the United States and the tropics have definite family characteristics. In the rose family, there are practically no poisonous plants. In the large bean family, on the contrary, some species make excellent food while the seeds of others are very poisonous. The emergency food manual is designed to give men with no knowledge of botany the information needed to make a proper selection. The tender central bud of most species of palms, the so-called palm cabbage, may be eaten either raw or cooked. Other palms, such as the sago, sugar palm, talipot, and fishtail palm, store up immense quantities of starch in their trunks, which can be extracted and used for food. Many members of the calla-lily family have fleshy roots which may be eaten provided you know how to eliminate the microscopic stinging crystals that make these plants intensely irritating when eaten raw. In general, the tender, uncurling leaves of ferns may be safely eaten. Young bamboo shoots also are excellent.

Dr. Merrill first became interested in economic botany when a small party of which he was a member was left on a remote island and the entire party existed on the unexciting diet of boiled rice three times a day for a week. Since then, experimenting with native foods has been his hobby.

**ITEMS**

The U. S. Public Health Service has received funds from the W. K. Kellogg Foundation for sixteen additional fellowships in health education. Each fellowship carries a monthly stipend of $100 for twelve months plus tuition and leads to a Master's Degree in Public Health. Studies may be pursued at Michigan and Yale in addition to the University of North Carolina, where 20 fellows are already training. The object of these fellowships is to train health educators to meet the present shortage of such personnel and an anticipated demand in the future in both this country and abroad. Placement after training is anticipated. The new fellows will start their training with the fall term at the respective universities. Applications and other pertinent material must be in the office of the Surgeon General, U. S. Public Health Service, Washington, D. C., on or before September 4.

**DISCOVERY**

Apparently for the first time on record, of a dog with two brains was made at the laboratories of the Health Department of the District of Columbia. Dr. John E. Noble, director, thought someone was playing a joke on him when first told of the discovery. The two brains in one head were discovered in a collie of mixed type, but no unusual appearance, by J. B. Holland. Mr. Holland was examining the dog's brain for rabies when he found the second, smaller brain behind the first, but also attached to the dog's spinal cord. Evidence of rabies was found in both brains. Authorities at the Bureau of Animal Industry, stated that they had never heard of such an anomaly before. Two-headed calves, five-legged animals and humans with an extra thumb or finger, yes; but a two-brained dog is apparently something new in the records. Dr. Noble suggests that there may be more such which never are discovered because, luckily, they fail to get rabies and have their brains examined after death. By the time the discovery of the second brain was made and verified, both had been handled too much to make it possible to preserve them as museum specimens.

**FRUIT JARS**

Jars for home and factory canning may be covered and sealed by what seemingly is a device never before used. It is called a 'side seal glass closure' and was developed by the Hartford-Empire Company, a manufacturer of glass machinery located in Hartford, Conn. The company is offering the design of this new glass closure freely to the industry as a contribution to the war effort. A pliable plastic material is used as a gasket to fit around and slightly above the top of the jar. When rubber becomes plentiful again, either natural or synthetic rubber gaskets may be used instead of the plastic. The rim of the glass cover is slightly bevelled on the inside. When the cover is placed over the jar and gasket and firmly pressed, it compresses the gasket and causes the projecting upper edge of it to mold itself over the top edges of the jar. Glass does not touch glass at any spot. The seal is perfect. The top is easily pried off when the jar is to be opened.
McGraw-Hill Books in Meteorology

An Introduction to Weather and Climate. New second edition

By Glenn T. Trewartha, University of Wisconsin. McGraw-Hill Series in Geography. 541 pages, $4.00

A revision and expansion of the author's well-known text, written from a climatic point of view and designed to provide an outline for a general course on the atmosphere. The material dealing with the elements of weather and climate has been largely rewritten; much new material on air masses has been added; and many other changes and additions have been made to bring the text abreast of the latest development.

Air Navigation. Introduction to Earth

Flight Preparation Training Series. Published under the Supervision of the Training Division, Bureau of Aeronautics, U. S. Navy. 79 pages, $1.00

Designed to orient the naval aviation cadet to navigation that may encircle the earth. The book gives an over-all view of the earth as a sphere, of place relationships of war zones, of general climatic considerations underlying strategy, etc. The many excellent maps are a feature of the book.

Aerology for Pilots

Flight Preparation Training Series. Published under the Supervision of the Training Division, Bureau of Aeronautics, U. S. Navy. 107 pages, $1.25

What the pilot must know about aerology. Emphasis is placed upon understanding of weather reports (forecasts, weather maps, and sequence reports) and the personal weather observations necessary to find favorable flying conditions and avoid or conquer weather hazards.

Workbook in Meteorology

By A. F. Spilhaus, Captain, U. S. Army, on leave from New York University, and James E. Miller, New York University. 163 pages, $2.50

A collection of project type exercises for use with any textbook on elementary meteorology. The exercises correspond to the chief divisions of meteorology: climatology, instruments and observations, physical and mathematical considerations, and weather analysis.

Introduction to Meteorology

By Sverre Petterssen, formerly of Massachusetts Institute of Technology. 236 pages, $2.50

A concise, nontechnical discussion of the basic principles of meteorology. The treatment is intended for the student without previous knowledge of the subject, and makes clear the various weather phenomena, atmospheric conditions, and other aspects of meteorological science applicable to forecasting.

Weather Analysis and Forecasting

By Sverre Petterssen. 505 pages, $5.00

Gives a complete, factual treatment of the principles of diagnosing the physical, dynamic, and kinematic atmosphere and comprehensively discusses the methods of their application to actual forecasting. Investigations in the fields of air-mass analysis, frontal analysis, and isentropic analysis are included.

Dynamic Meteorology

By Bernhard Haurwitz, Massachusetts Institute of Technology. 365 pages, $4.00

An introduction to dynamic meteorology, giving a lucid treatment of the laws of thermodynamics and dynamics that operate in the atmosphere—a fairly elementary discussion of the fundamental principles and theories underlying the modern methods of airmass analysis, isentropic analysis, and frontal analysis.

Elementary Meteorology

By Vernon C. Finch and Glenn T. Trewartha, University of Wisconsin. M. H. Shearer, Westport High School, Kansas City, Mo., and F. L. Caudle, Oshkosh, Wis., State Teachers College. 290 pages, $1.76

Written for very elementary preflight courses, this text shows the student how atmosphere, weather, climate, and natural phenomena influence flying and how accurate knowledge of weather conditions determine the success of every long flight.

McGraw-Hill BOOK COMPANY, INC.
330 West 42nd Street, New York 18, N. Y. Aldwych House, London, W.C.2
Smooth, Vibrationless Drive with full power of motor delivered at all speeds

Throughout the entire speed range of 75 to 1300 r.p.m., the Sargent Cone Drive delivers full motor power, is vibrationless and silent, and assures constancy of any selected speed. It is, therefore, as efficient for such applications as the rotation of electrodes and calorimeter paddles at speeds of about 200 r.p.m. or less, as it is for general stirring operations at higher speeds. Fine adjustment of speed is made by means of an adjusting nut and lock which changes the effective diameter of the cone in contact with the friction ring. Because the motor is a brushless, induction type not containing centrifugal switches, it is relatively safe against explosion. The simple right angle clamp permits rapid adjustment of the motor to any desired position in horizontal and vertical planes.

S-76445 Sargent Cone Drive Stirring Motor. (Patent No. 1,973,576.) Complete with cross support rod, right angle clamp, one extra friction ring, connecting cord and plug, but without support stand. For operation from 115 volt A.C. 60 cycle circuits...........$28.50
S-76455 Ditto. But for 115 volt D.C. circuits. 32.00
S-76465 Ditto. But for 230 volt A.C. 60 cycle circuits ............... 29.50
S-76475 Ditto. But for 230 volt D.C. circuits. 33.00
S-76480 Anode Chuck and Cathode Collet...... 1.50
S-79225 Support only for Sargent Cone Drive Stirring Motor. Designed with considerable mass to minimize support vibration. The heavy U shaped base accommodates vessels up to six inches in diameter and larger vessels can be placed on top of the base which has a flat surface. Supplied with a 5/8" rod, 30 inches long and adjusting screws to insure a solid four point support on any surface. Each............................$ 5.00

E. H. SARGENT & COMPANY, 155-165 E. Superior St., Chicago, Ill.

Michigan Division: 1959 East Jefferson, Detroit, Michigan
"Target for Tonight"

In the "Ready Rooms" of aircraft carriers, in flight quarters at aviation land bases, in classrooms for maintenance instruction courses, projection instruments are performing vital services in the war of today.

Of the various types of Spencer projectors suitable for these tasks, the VA Delineascope has been especially useful since it is capable of projecting slides or opaque material, such as photographs, charts, maps or drawings.

Optical instruments are so vital to war and public health that the nation's needs absorb practically all of Spencer's greatly increased production.
