Cummins and Midlo
Finger Prints, Palms and Soles
An Introduction to Dermatoglyphics

This new book is designed to fill the need for a comprehensive treatise on the subject in which the latest knowledge and progress is recorded. The authors show many new applications in practical science work of the knowledge presented including valuable data on a much neglected phase of human biology. The book is of interest to anatomists, physical anthropologists, geneticists and zoologists as well as those dealing with identification studies alone.

Nature Magazine, says: "This book is an excellent example of modern, painstaking, detailed research; the amount of documented material is enormous, and very well illustrated. . . . It is a splendid new addition to the literature of human biology, anthropology, genetics, criminology, and related fields."

By HAROLD CUMMINS, Ph.D., and CHARLES MIDLO, M.D., Tulane University, School of Medicine. 149 Illus. 309 Pages. $4.00 (1943)

Snell (Editor)

Biology of the Laboratory Mouse

This book provides in one convenient volume all the data concerning the mouse that are of use to the laboratory worker. It is the joint work of the staff of the Roscoe B. Jackson Laboratory, under the editorship of Dr. G. D. Snell. A chapter on Infectious Diseases of Mice, by Dr. J. H. Dingle (Harvard) is included.

Science, says: "Altogether this is an excellent book, and by writing it the staff of the Jackson Laboratory has made another distinctive contribution. It will be very helpful to investigators in the fields of genetics, tumors, endocrinology, as well as pathology and biology in general.

172 Illus. 497 Pages. $7.00 (1941)

Strong

Stitt's Diagnosis, Prevention and Treatment of Tropical Diseases. 6th Ed.

This book offers an authoritative and practical account of tropical diseases, their clinical manifestations, diagnosis and latest methods of treatment. It discusses the zoological aspects and the laboratory procedures of importance and gives attention to health problems relating to the prevention of infectious diseases. It also includes a special study of the occurrence and prevalence of diseases in Central and South America and to important recent investigations on tropical medicine.

Science, says: "An outstanding contribution to the literature on tropical medicine. It provides an enormous amount of detailed information. . . . there is no single work which approaches the usefulness of this text."

By RICHARD P. STRONG, M.D., Sc.D., D.S.M., Professor of Tropical Medicine Emeritus, Harvard University. 398 Illus. Tables. 1827 Pages. $21.00 (1942)
Astronomy

Evidence of gold in the sun was obtained by comparative study of gold spectrum lines and the solar spectrum.

Thorium, rare radioactive element, was discovered in the sun by detecting lines in the solar spectrum that matched lines of thorium produced in the laboratory.

The sun entered a new 114-year sunspot cycle with the first new spot group appearing as expected well away from the sun's equator and one of the last spot groups of the old cycle still visible close to the equator.

New comets discovered were: Diamaca, Oterma III. Periodic comets rediscovered were: Comas-Sola, last seen in 1935; Comet d'Arrest, last seen in 1923.

A nova or exploding star was discovered in the constellation Aquila.

Nova Puppis, discovered in November, 1942, faded below naked-eye visibility.

The shell of the star 48 Librae was found to be composed of separately rotating hot layers.

In February, Comet Whipple II increased its brightness by nearly two magnitudes in a sudden and unexplained manner.

Nitro-hydrogen molecules made up of more than two atoms and hitherto unidentified in comets were found by spectrogram measurements to be numerous in the heads of Comet Cunningham and Comet Whipple II.

One star of the binary Beta Cephei was found to be the brighter member in a double star with a period of 50 years.

Chemistry and Physics

Biotin, recently discovered vitamin of the B group, was made synthetically, thus affording more ample supplies for research in human nutrition.

A new method of preserving vitamin C in evaporated milk by sealing the evaporated milk tins in an atmosphere of nitrogen or under vacuum was developed. This increases by 50 per cent the vitamin C retained after six months' storage.

Riboflavin (vitamin B2), important in the prevention of certain eye and skin diseases, was found to be present in the soil and in a special yeast first isolated from sour milk.

Two important vitamins, riboflavin and thiamin, were recovered in quantity from brewery wastes by the use of an insoluble synthetic resin, Amberlite IR-100.

An inexpensive process for recovering a billion pounds of food protein annually from wheat used for alcohol production was developed.

A process for obtaining large quantities of protein for possible human consumption from a "defatted" corn germ was developed.

A concentrated protein extract to be used as a substitute for scarce grain in livestock rations was obtained by chemical treatment of grass.

A method for quicker and cheaper removal of proteins from distillery wastes by use of bentonite, a fine clay, was developed, thus affording valuable protein cattle food.

A sticky starch, used as a substitute for tapioca and for textile sizing and finishing and for paper coatings was made from certain kinds of corn and sorghum.

Wheat gluten, a by-product in the manufacture of wheat starch, was found to make a good adhesive when dissolved in dilute ammonia.

Foods dried in a natural gas atmosphere, which is later burned to heat the dehydration unit, retained almost all their vitamin C and original color and taste.

The mechanism by which auxins, hormone-like substances, stimulate plant growth was discovered to be by the release of an enzyme, diastase, from protein colloidal substances.

A new kind of synthetic rubber, Paramon, was developed which will be valuable as a special replacement for natural rubber, particularly in the aircraft industry. New war gases, nitrogen mustards, were developed and found to have a milder blistering action than mustard gas and to cause blindness.

For the first time 100,000,000 volt X-rays, 50 times greater than any previous voltage, were produced.

Radar, a locator using ultra-high frequency radio waves, although developed earlier, was announced.

A new phosphorescence microscope for the examination of objects by their own short-lived glow after ultraviolet irradiation was devised.

A huge optical glass disk, the largest prism ever made, measuring 26 inches in diameter, graduated in thickness from one and one half inches to three and one quarter inches and weighing 260 pounds, was successfully cast for use in an astronomical telescope.

Earth Sciences

Paricutin, a new volcano 200 miles west of Mexico City, arose from a cornfield to a height of 1,000 feet and is the first whose entire life is recorded scientifically.

Evidence of a long wet spell 120 million years ago was found in fine white clays of the Southwest.

The 250 million-year-old fossil remains of a giant amphibian with a skull more than two feet long were found in Texas.

Legendary pit of Taso, Mexico, known as Hell's Mouth, was found to be only 500 feet deep instead of a mile and was dynamited to close it and prevent its use as an illegal execution spot.

Issuance of daily weather maps and fuller forecasts by the U. S. Weather Bureau was resumed when it was concluded that this information would be of less value to the enemy than to our own war efforts and production.

There were 43 earthquakes of sufficient strength to record themselves on distant seismograph instruments; notable among them was a double shock off the coast of Japan in the same region where the disastrous tidal wave of 1933 started.
McGraw-Hill Announces

THE PENNSYLVANIA STATE COLLEGE MINERAL INDUSTRIES SERIES

"This new series is to include books that will serve as texts and reference works for students and industrial personnel interested or employed in one of the various phases in the field of mineral industries. Broadly, this field includes the primary and secondary processing industries which are engaged in finding, recovering, and processing the mineral wealth. The books of this new series are written in such a manner that the highly technical subjects necessarily covered are presented in the most fundamental way possible, and yet retain in full the industrial applications of all phases of the subjects covered."

—H. B. Northrup, Director, Mineral Industries Extension, The Pennsylvania State College

AVIATION GASOLINE MANUFACTURE

By Matthew Van Winkle, University of Michigan; formerly of The Pennsylvania State College. 274 pages, 5½ x 8¼. $3.00

Fills a definite need for a text in the highly specialized and important field of gasoline manufacture. The author deals with the manufacture of base stocks, high octane hydrocarbons, the finished fuels, and special fuels and the characteristics of such fuels in use in aircraft engines. The book also covers the processes used, specifications, tests, etc., and is a source of original references.

FERROUS METALLURGY

By E. J. Teichert, Metallurgist, E. G. Budd Mfg. Co.; formerly of The Pennsylvania State College

Volume I. Introduction to Ferrous Metallurgy
Second edition. 475 pages, 5½ x 8¼. $4.00

This is the first of a series of three volumes written to embrace the entire field of ferrous metallurgy. In this first volume the treatment is new in that it includes fundamental science and related subject matter vital to an understanding of metallurgical processes. Presented in logical sequence the topics covered are pyrometry, metallurgical fuels and their combustion, refractories, fluxes, slags, iron ores, the iron blast furnace and manufacture of pig iron, the iron foundry, malleable iron, wrought iron, and the manufacture of crucible steel.

Volume II. The Manufacture and Fabrication of Steel
Second edition. 468 pages, 5½ x 8¼. $4.00

In this volume the author covers all the common methods in the manufacture and processing of steel, including its primary fabrication. The latest and best available information on plant practice is embodied in the text through the cooperation of leading manufacturers in the field. Topics discussed include the Bessemer process, the basic open hearth process, the acid open hearth process, the electric furnace processes, special steel making processes, the steel ingot, the fabrication of steel, rolling mill practice, etc.

Volume III. Metallography and Heat Treatment of Steel. In preparation

McGRAW-HILL BOOK COMPANY, INC.
330 West 42nd Street, New York 18, N. Y.
New deposits of quartz, suitable for use in military radio and radar apparatus, were discovered in North Carolina, Virginia, California and Arkansas.

Ancient ocean beds in Idaho and Wyoming were found to contain vanadium, estimated at millions of tons.

**BIOLICAL SCIENCES**

About 200,000 quinine-bearing cinchona plants, grown from seeds rescued from the Philippines during invasion, were sent to neighboring republics for planting.

Fresh evidence that virus disease particles are giant protein molecules capable of reproduction and parasitic feeding within living cells was obtained by means of the ultra-centrifuge, which whirls solutions at high speeds and separates and sorts the particles.

A strain of mold was induced by x-ray to undergo genetic changes from which were established many pure lines specifically deficient in ability to synthesize dietary essentials; these strains offer new approaches to the study of biochemistry and genetics and have also proved extremely valuable in delicate chemical analysis of food.

Plant tumor bacteria, when deprived of power to cause abnormal growths through use of glycine regained it when treated with hormones; bacteria from the tumors thus caused were unable to produce new tumors unless again aided by hormones.

A deadly poison, extracted from a microbe in the soil, was discovered as a possible rodent exterminator when laboratory tests revealed it not as a germ killer for mice, but a killer of the mice instead.

Large-scale use was made of an enzyme formed in mass-cultured mold for the splitting of starch into sugar for fermentation into industrial alcohol.

Special strains of yeast were developed, having nutritious qualities and flavors of meats and other foods.

A new synthesized female sex hormone was developed by combining sulfur with the natural female hormone, estroline.

Prenatal control of sex of fruitflies was accomplished by genetic selection.

Pellets of synthetic female sex hormone, diethylstilboestrol, inserted under the skin of young roosters, made them resemble hens.

Tests and experience of new tillage methods, dispensing with mold-board plows that turn all the vegetation under, proved highly successful.

Night-time temperature was found to affect differently blossom induction and other activities of warm-climate plants and cool-climate plants.

**ENGINEERING AND TECHNOLOGY**

The "pancake" Diesel engines now powering Navy ships were revealed to put out more than four times the power per pound of former Diesel engines and to occupy only a third of the space.

Gas turbines capable of initial temperatures of 1,500 degrees Fahrenheit were made possible by the development of heat-resistant alloys.

A speedy, economical process for food dehydration which for the first time reduced the moisture content to 1 per cent. was developed through use of radio-frequency energy.

Copper-covered steel wire for high frequency communication lines was developed and found as efficient as solid copper wire.

Special thick-walled tires built to be run without tubes were produced for Army use.

Tubeless tires completely filled with an anti-freeze solution of calcium chloride as an inner liner for preventing air diffusion were developed.

Speedy continuous tinplating processes, which save much tin, were developed by the use of new and improved chemicals in electroplating.

A non-skid, fireproof plastic material containing particles of garnets went into use on battleship decks to prevent slipping accidents.

The bazooka, using deadly rocket projectiles with highly brisant explosive charge, was announced as a new war weapon and proved effective in combat.

A new and superior optical glass, made without sand, was developed from common chemicals such as boric acid, zinc oxide and aluminum hydroxide.

A walnut-sized searchlight, projecting a 1,500 candle-power beam of light viable for 65 miles at sea, was designed.

Colored smokes from grenades aided American tanks in identifying themselves to friendly planes in the Tunisian campaign.

A new airplane compass, the Gyro Flux Gate Compass, which is not affected by bombload, motion of the plane, armor plate or other metal parts of the plane, was developed.

The Army's new submachine gun, M3, was scheduled to supplant all other weapons of the same type due to performance records and the fact that it can be produced without complicated machine tools.

"Electrical nurses" for the 20-inch pipeline between Texas and the East Coast were developed to record temperature of motors, pumps and bearings, pressure in the pipe and direction of fuel flow.

Plastic lithographic printing plates, replacing critical zine and aluminum, were made from polyvinyl alcohol resin for use in printing colored maps and documents and in mobile field printing units.

Washing films and prints, after fixing with hypo, first with sea water and then with fresh water, was found to speed the job in photography.

A compact, easily portable mercury flash lamp outfit which takes photographs with an exposure of only one-millionth of a second was developed.

Stainless steel sheets were stitched together with an electric thread or current which shoots clear through the metal and fuses the sheets together at their inner surfaces.
New Interscience Books

CELLULOSE and CELLULOSE DERIVATIVES
High Polymers, Vol. V.

Edited by Emil Ott, Director of Research, Hercules Powder Company, Wilmington, Del.
The book is the well-designed cooperative effort of a number of experts in science and industry, under the determined guidance of Dr. Ott, to present an authoritative scientific picture of the cellulose field, with emphasis on the chemistry and physics of cellulose and its derivatives.

6 x 9 1200 pages 72 ill. $15.00

THE CHEMISTRY of LARGE MOLECULES

Edited by R. E. Burke, The Standard Oil Co., Cleveland, Ohio, and O. Grummitt, Western Reserve University, Cleveland, O.

Report on recent developments in the chemistry and physicochemistry of Plastics and Elastics.

6 x 9 352 pages 65 ill. $3.50

THE CHEMICAL BACKGROUND of ENGINE RESEARCH
Frontiers in Chemistry, Vol. II.

Edited by R. E. Burke, The Standard Oil Co., Cleveland, Ohio, and O. Grummitt, Western Reserve University Cleveland, O.

Report on recent investigations and interpretations of combustion processes and lubrication.

6 x 9 327 pages 83 ill. $3.50

MEDICAL CLINICS on BONE DISEASES
A Text and Atlas.

By I. Snapper, formerly Peiping Union Medical College, Peiping, China.
The first exhaustive treatment in the English language of an important field of medicine. The approach is not that of the surgeon, but that of the internist. Diagnosis, Biochemistry, Histology, Clinics and Therapy are dealt with in a well-balanced manner. The many illustrations make the book an atlas of the field.

8½ x 10¾ 225 pages 190 ill. $10.75

LUMINESCEENCE of LIQUIDS and SOLIDS

By P. Pringsheim, University of Chicago, Chicago, Ill. and M. Vogel, San Francisco, Calif.

An attempt to explain, from the physicist's point of view, the nature and causes of luminescence and the experimental technique of studying luminescence. It surveys all inorganic and organic luminescent substances.

6 x 9 200 pages 72 ill. $4.00

MAGNETOCHEMISTRY

By P. W. Selwood, Northwestern University, Evanston, Ill.

First American monograph of the field of magnetoc hemistry. The author has given a comprehensive and critical survey of the extensive literature of this important new branch of physicochemistry.

6 x 9 300 pages 80 ill. $5.00

STATISTICAL ANALYSIS in BIOLOGY

By K. Mather, John Innes Horticultural Institute, London, England

This book presents, in simple terms, the basic theory of modern biological statistics, thus providing biologists with the means of understanding the special uses of the available techniques, and of deciding on the methods which best meet their needs.

5½ x 8¼ 247 pages 9 ill. 58 tables $4.50

METHODEN der MATHEMATISCHEN PHYSIK

By R. Courant and H. Hilbert

The Allen Property Custodian authorized us to make this Standard Work of the mathematical literature available to American mathematicians, physicists, and engineers. One of the authors, Professor R. Courant, is head of the Department of Mathematics at New York University.

Vol. I 6 x 9 450 pages 26 ill.
Vol. II 6 x 9 552 pages 57 ill.
Two volume set: $14.00
Single volumes: $8.00

WHY are C&B Chemical Indicators given special recognition for DEPENDABILITY?

Try them for the work in which you are engaged. Make comparisons.

Available in C&B Chemical Indicators are rare indicators suitable for special work, the hydrogen-ion indicators recommended by Sorenson and Clark & Lubs as well as all of the indicators commonly used in analytical and biological research.

C&B indicators are obtainable in dry form and in solution, ready to use. Certain indicators are offered in the form of Test Papers.

Write for the C&B Catalog.

A Popular Book on Meteorology
WAYS OF THE WEATHER
By W. J. HUMPHREYS, PH.D., Sc.D.
U. S. Weather Bureau

"Probably the most complete and simply worded account of the weather and climate thus far published in English ... at once clear and authoritative."  WALDEMAR KAEMPFERT, Book-of-the-Month Club News.

400 pages, fully illustrated, $4.00

THE JAQUES CATTELL PRESS
Lancaster, Pennsylvania
This oscillogram served to identify one alloy from another in sorting inadvertently mixed machine parts.

This is what an ignition equipment manufacturer saw when a defective condenser was across breaker points.

This oscillogram showed a musical instrument manufacturer when he had achieved good accordion tone.

Oscillograms, such as these, vividly traced on the DuMont Oscillograph screen, permit either a quick grasp or a detailed study of simple or intricate electrical functions, circuits, equipment.

Yes, it pays to put such matters in electronic writing these days. More and more studies, presentations, tests, maintenance problems, are being handled that way.

And DuMont equipment, because of its versatility of application as well as sharp, detailed, brilliant, high-fidelity oscillograms, is the recognized standard the world over.

"Fire when ready!"

Dramatic seconds pass while the enemy plane approaches. It must be brought down or a U.S. ship may sink below the waves. Accurate marksmanship literally becomes a life-or-death matter. And accuracy depends on many factors—chief among them being the gunsights such as supplied by Spencer.

The Navy and Army have entrusted the manufacture of some of the most intricate optical devices to Spencer because of a long record of success in producing scientific optical instruments of great precision.

In addition to thousands of standard microscopes and other instruments being made for the armed services and war industries, Spencer's production includes periscopes, telescopes, aircraft gunsights, prism binoculars, azimuth instruments for directing artillery fire, tank sights, and telescopic alidades for navigation.

Optical instruments are so vital to war and public health that the nation's needs absorb practically all of Spencer's greatly increased production.
