Colorimetric Analysis is
Simple—Rapid—Accurate
with the AC Model
Fisher Electrophotometer

The Fisher AC Model Electrophotometer permits colorimetric analyses to be made accurately, quickly and simply wherever the color of the solution varies in a definite manner with the concentration of a constituent. It has unique, valuable features which enable the laboratorian to employ this rapid method for control or research work.

The Electrophotometer is an improved instrument that operates from any 110 volt, 50–60 cycle line. With it, the user can detect very slight color intensity differences because the photoelectric system it employs is considerably more sensitive than the human eye. The Electrophotometer is extremely simple to operate; there are no complicated manipulations and each determination requires less than a minute. Once a calibration is made, subsequent analyses can be conducted as rapidly as the simple operations can be performed.

All essential parts needed to conduct an analysis are furnished with the instrument, including the built-in galvanometer, set of three standard filters and three 23-ml Absorption Cells. Typical procedures and step-by-step directions are also supplied.

For 110 volts, 50–60 cycle A.C. only. Complete, .................................................. $150.00.

A clear, non-technical discussion of war injuries and diseases, new remedies and treatments in Medicine and the War

Edited by WILLIAM H. TALIAFERRO

Written by specialists for the layman, this book by eleven members of the medical faculty of the University of Chicago gives authoritative information in understandable language about the sulfa drugs ... blood substitutes ... malaria ... psychological effects of brain injuries ... the difference between surgical "shock" and psychiatric "shock" ... aviation sickness, etc. A chapter on chemical warfare forcefully presents a controversial viewpoint. $2.00

New (5th) Edition Just Ready

A TEXT-BOOK OF PATHOLOGY

Edited by E. T. BELL, M.D.

Contributors
E. T. BELL, M.D., B. J. CLAWSON, M.D., J. S. McCARTNEY, M.D.
University of Minnesota, Minneapolis, Minn.

Octavo, 862 pages, illustrated with 448 engravings and 4 colored plates. Cloth $9.50

This new edition brings this standard work completely up to date. A larger type page has made it possible to increase the text material substantially without increasing the size of the book. It gives the student a text-book which he may use during his clinical training and that he will find valuable as a reference work in further practice.

LEA & FEBIGER

Voltage indication is proportional to average value of the full wave

YOU CAN MAKE accurate high frequency measurements (up to one megacycle) without particular precautions with this -hp- Model 400A Vacuum Tube Voltmeter. There are no adjustments to be made during operation and the impedance is so high the circuit being measured is unaffected by the instrument. Since voltage indication is proportional to the average value of the full wave, turn-over effects and waveform errors are minimized. It is ideal for measuring amplifier gain, network response and output level. Its sensitivity is sufficient to measure hum level directly in many cases. Wide frequency range makes this instrument suitable for work at audio frequencies from 10 cps to 20 kc and also for carrier current work in supersonic region, in television and the entire broadcast field. Write today for more complete data on this outstanding instrument. Ask also for your copy of the -hp- catalog ...24 pages of technical information plus complete listing of all -hp- instruments.

Deepfreeze Desiccators... for Faster, More Complete Desiccation from the Frozen State of Penicillin, Plasma and other Biologics

300 cc Units Plasma Dried in Approximately 6 Hours to Less Than 0.1 Per Cent Moisture

Deepfreeze, North Chicago, Illinois, Division of Motor Products Corporation, Detroit, Michigan, has designed a machine for drying, from the frozen state, sensitive and unstable biologics on a commercial production scale. This new Deepfreeze Desiccator, highly efficient and fast in its action, has been used for drying plasma, penicillin, vaccines, etc. This new process yields a very fine, dispersed, dry product which dissolves almost instantaneously. Furthermore, since the material is dried from the frozen state and never passes through a liquid phase, no denaturation of the chemical constituents takes place.

The principle underlying the operation of this machine has been developed and tested by the staff of a hospital research foundation. This institution has consistently dried standard volumes of blood plasma in six hours with a final moisture content of less than 0.1 per cent. Several machines of this type in operation for commercial purposes are proving highly successful. One large pharmaceutical house is using this machine in preparing delicate chemical compounds which permit a long storage period because of the ability to reduce the moisture content to a negligible amount.

Three standard sizes of machines are available. The large machine has a capacity of removing up to fifty pounds of water per hour. Special machines and special modifications can be furnished to meet individual requirements.

Additional Information Write today for additional information and data concerning the actual large scale production with the Deepfreeze Desiccating Machine. A staff of research consultants is available to help adapt these desiccating machines to meet your specific requirements.

Choline Chloride, Cystine and Methionine, prepared in the Research Laboratories of S. M. A. Corporation, are available to the laboratory investigator in these convenient amounts.

**CHOLINE CHLORIDE**
- 25 gram bottle: $1.75
- 100 gram bottle: 4.65
- 1000 gram bottle: 35.00

**1-CYSTINE**
- 10 gram bottle: $1.00
- 100 gram bottle: 7.50
- 1 pound bottle: 15.50

**d1-METHIONINE**
- 1 gram bottle: $1.00
- 10 gram bottle: 9.00
- 100 gram bottle: 60.00

Employees can't misunderstand—when they have photo-exact copies of letters, orders, blueprints, technical data or sketches. A dozen departments or branch offices can have A-PE-CO photo-copies on file! You can copy practically everything—even blueprints of which no tracings are on hand. Any office boy or girl can make A-PE-CO photo-copies quickly and easily. No technical knowledge necessary. Thousands of America's largest business houses have found the A-PE-CO Photo-Copyer indispensable. See how you can use it to avoid mistakes and save time.

WHATMAN Filter Paper No. 7 is an excellent grade for many volumetric procedures where precipitates must be removed for subsequent titration as in the determination of Phosphorus or Copper.

No. 7 is a rapid filtering paper yet retains most precipitates encountered in volumetric analyses. It can be washed thoroughly without breaking, yet pulps well for titrations. The slightly roughened surface hinders the crawling of precipitates and the texture permits No. 7 to be fitted tightly in the funnel.

No. 7 is widely used in laboratories analysing steel, copper, fertilizers, foods as well as in Educational and Research laboratories.

Samples cheerfully supplied.

Standardized Control for Today's Vital Products

From vitamins to battleships, America's war production moves forward faster and more effectively because of the standardized control spectrography makes possible.

This is another example of the application of the peacetime experience of Bausch & Lomb to a vitally important war role. In 1943, as in 1917, this experience acquired in the development and manufacture of optical instruments, peacetime education, research and industry becomes one of America's most valuable wartime assets.

The B&L Spectrographic Equipment is but one of many B&L optical instruments of peacetime science, industry and education that serve with growing usefulness beside the B&L Optical Instruments of war.

Here again, because of its wartime accomplishments, Bausch & Lomb will be able to extend its optical services to peacetime pursuits when Victory is won.

For Bausch & Lomb Instruments essential to Victory—priorities govern delivery schedules.
