Thus, in case of the Fohn wind, for this air to arrive in the valley at a temperature 60°F. above the temperature normally found there, it must have been heated 60° above the temperature normally found at the summit of the mountains from where it started, and it then remains with Dr. Hann to explain how this air acquired the abnormally high temperature before it commenced to descend, and until he has done this he can have no right to claim that he has added one particle towards the explanation of the phenomena of the Fohn; and, even if he was able to get over this difficulty, it still remains for him to explain the phenomenon of the sand-dust, before it can be recognized that the birthplace of the Fohn is anywhere but in the Desert of Sahara.

The phenomenon of cool night wind from the mountain and the accompanying higher temperature on the mountains than in the valleys find a ready explanation from the same premises. During clear nights the air nearest the earth's surface gets abnormally cooled through radiation, and the radiation is more intense on the mountains than on the plains. The cool contracted air will run off the slopes of the mountain and accumulate in the valleys, while its place on the mountain-side is immediately taken up by air which has not as yet been cooled down by radiation. In the valleys the temperature gets lower than on the mountains, or the plains, because the cooling effect of radiation is there acting upon air which has previously been cooled considerably down by radiation on the mountain, and it is clear that the temperature must sink lower when radiation is acting upon air already cooled down, than when the temperature of the air was higher to start with.

The present writer has, on several occasions, tried to induce so able and prolific writer as Professor Hazen to attack his views for the sake of an argument, but the professor seems to decline to enter upon a discussion with any body who does not belong to the "meteorological camp," as he calls it. Now, be it said that all kindness, that in our advanced age every body seems to be entitled to express his opinions on any scientific subject when he feels himself convinced of having found something new which may add to the progress of science, and also be entitled to a fair hearing; but be it said, as my impression when I accidentally arrived in the meteorological camp, all the inmates seemed to have decamped previously, leaving no one behind to shake hands with me; and this I thought a little discouraging. Dr. Hann may be a most excellent director of the Hohe Warte, and it may seem not a little reckless for an outsider to attack his theories; but it should be remembered that even a blind man may sometimes find a seed,—although a civil engineer of high training may not be entirely blindfolded,—and if there be any truth in the maxim of Dr. Hanno's countryman, Feuerbach, "that no philosopher ever yet occupied a professorial chair in philosophy," so entirely is it equally true that no meteorologist in meteorology ever yet sat on Hohe Warte, however great his attainments as director or weather forecaster might have been.

FRANZ A. VELTSCHOW, C.E.

Brooklyn, Nov. 9.

**Auroral Phenomena.**

As Dr. Veeder has mentioned in his description of the aurora of Sept. 9, in Science for Nov. 6, some phenomena not ordinarily accompanying auroral displays that were also visible here, some not, in the same time may be of interest.

The aurora on that evening was unusually fine, probably the most brilliant observed in four years. It began about 7:40 P.M. as a faint arch five degrees above the northern horizon, which gradually became higher until a maximum height of eight degrees was reached at 8:15 P.M. Shortly before this time two smaller arches appeared beneath the principal arch, and soon afterward the ends of the three joined together, forming a serpentine band. This band at 8:30 P.M. broke up into brilliant streamers, which were constantly changing in appearance and length, alternately fading and becoming bright again.

This continued until 8:50 P.M. when the display reached its maximum brightness and the streamers their greatest length. The elevations of the ends of the streamers above the horizon were measured with a theodolite at times, the highest being at a height of 86°, though many exceeded 45°. Between 8:15 and 8:30 P.M. the aurora diminished greatly in brightness, and at 9:25 two bands extended toward the zenith from the east and west respectively, joining together at 9:27, forming the narrow band that Dr. Veeder saw. This band was apparently of a uniform brightness, approximating that of the Milky Way, and continued, through the period of minimum brightness of the aurora, from 9:33 to 9:35 P.M. After 9:35 P.M. the aurora became brighter, and was visible at 11:40 P.M.

This band of light was seen at Nashua, N.H., and in this vicinity, while the aurora has been reported as visible at several places in Europe as well as America.

A similar band of light, extending through the zenith from opposite sides of the horizon, was observed during the aurora of May 20, 1888, which was described in Science by several observers during the succeeding month.

Five auroras were visible during September four of which occurred on the 7th, 8th, 9th, and 10th, respectively,—an unusually large number for such a short period of time.

S. P. FERGUSON.

**AMONG THE PUBLISHERS.**

D. C. HEATH & CO., Boston, will soon publish Business Law, prepared by Alonso P. Weed. This is not only a text-book for business colleges and the business courses of schools and academies, but it is desirable for the desk of the business man.

Charles F. Lumniis, a Harvad man, who has lived for many years in New Mexico, begins in the Christmas Scribner a group of articles on that little-known territory, with its population of Pueblos, Mexicans, Navajos, and Americans. The articles will be illustrated from the author's own photographs, which are unusual in subject and variety.

The October number of the "Papers of the American Historical Association" contains six articles. The first is a brief account of "Slavery in New York" under the colonial government. Then follow two papers on certain aspects of our national Constitution, the one on "Congressional Demands upon the Executive for Information" being the most suggestive. The next is "A Plea for Reform in the Study of English Musical History," and there is also a lengthy article on the "Yasso Land Companies," giving an account of a gigantic land speculation of a century ago, in which political intrigue played a prominent part. But the article that will be likely to interest the greatest number of readers is that on "The Lost Colony of Roanoke," by Stephen B. Weeks. The colony planted by Raleigh on Roanoke Island and has always been supposed to have perished, but in 1885 Mr. Hamilton McMillan of North Carolina advanced the theory that the colonists retreated inland, where they ultimately intermarried with some friendly Indians, and that the Croatan Indians, now living in the western part of the State, are their descendants. The evidence for this theory in the physique, the traditions, and the names of those Indians is really quite striking; and persons interested in our early history will like to read Mr. Weeks's paper.

A second edition of "Modern American Methods of Copper Smelting," by Dr. E. D. Peters, Jun., has just been published by the Scientific Publishing Company of this city. The book has met with great success, and the demand for it having long since exhausted the first edition. The entire book has been practically rewritten, and new chapters have been introduced on the electrolytic assay of copper, the smelting of copper with gas in regenerative furnaces, and the smelting of copper-nickel ores in water jackets. Additions of great importance have also been made to the chapter on reverberatory smelting, and this portion of the work has been illustrated by nine full sized pages, which form what is said to be the most complete and detailed working drawings of the kind ever published. The arrangement of the book has been improved; and in addition to the full alphabetical index at the end, a detailed table of contents has been prepared that will be a great aid to the reader. The author has brought a ripper ex-
percieved to the preparation of this edition, having been actively engaged in the writing of a book during the period that has elapsed since the first appearance of the book; and before preparing the new material he made a special trip through the West to note any improvements or modifications in the treatment of copper ore. The price of the book is $4.

— "Star Land," by Sir Robert Stawell Ball, F.R.S., Royal Astronomer of Ireland, published by Ginn & Co., is composed of talks with young people about the wonders of the heavens, told in a very interesting and attractive style. The text of the twelve full-page pages, some of which are colored, are absolutely new, and there are improvements in the woodcuts, of which there are to be 800, instead of 500, as in the previous edition. Special attention has been given to all that pertains to the practical construction and use of the instrument; and the interests of amateurs have not been neglected. The earlier chapters of the book have been entirely rewritten, and the work throughout has been brought up to date.

The Chautauquan for December has several illustrated articles and portraits of a number of prominent men and women. The following titles are from the table of contents: "Domestic and Social Life of the Colonists," III., by Edward Everett Hale; "The Colonial Shire," by Alfred Bushnell Hyneman, Professor of History of Political Parties in America," III., by F. W. Hedges.

HANDBOOK OF METEOROLOGICAL TABLES.
BY ABST. PROF. H. A. HAZEN.
127 pp. 8°.

Professor Walden says: "I heartily recommend them to all workers in meteorology, and do not see how any of our American meteorologists can afford to be without a copy."

Professor Symons says: "They are unquestionably valuable helps, which must be kept handy, and replaced when worn out."

— Professor A. D. Morse is the author of a monograph recently published by the American Academy of Political and Social Science, on "The Place of Party in Political System." It is a treatise on the philosophy of party, a subject which has been generally neglected by political scientists. After showing by what other means the State has sought to bow the government in due subordination to itself, he proves that the institution of party is the best device for accomplishing this end. He shows how party carries out its two chief functions, namely, to educate and organize public opinion, and to administer government. In regard to the latter function, he holds that under a system of party government, the party in power does the work which falls to the king in a system which is really monarchical. The monograph will doubtless create considerable discussion, as we are not wont to put so high a theoretical value to the party system.

— D. C. Heath & Co. will publish shortly "Reading and Speaking: Familiar Talks to Young Men who would Speak well in Public," by Brainard Gardner Smith, associate professor of elocution and oratory, Cornell University. Special importance is given to the theory of sentential delivery as based on the systems of Walker and Mandeville.

A Tonic

Horsford's Acid Phosphate,
A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. Ephraim Bateeman, Cedarville, N. J., says:

"I have used it for several years, not only in my practice, but in my own individual case, and consider it under all circumstances one of the best nerve tonics that we possess. For mental exhaustion or overwork it gives renewed strength and vigor to the entire system.

Descriptive pamphlet free.

Runford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION.—Be sure the word "Horsford's is on the label. All others are spurious. Never sold in bulk.

DO YOU INTEND TO BUILD?

If you intend to build, it will be a mistake not to send for "SENSIBLE LOW-COST HOUSES," now arranged in three volumes. In them you will find perspectives views, floor plans, descriptions, and estimates of cost for 102 tasteful, new designs for houses. They also give prices for complete Workmen Plans, Specifications, and Materials, which enable you to build without delays, mistakes or quarrels with your builder, and which any one can understand. Vol. I. contains 28 copyrighted designs, costing between $50 and $100. Vol. II. contains 32 copyrighted designs, $50 to $200. Vol. III. contains 35 copyrighted designs. Price, by mail, $1.00 each, or $3.00 for the set.

"PICTURESQUE HOUSES FOR FOREST AND SHORE!"—This show Perspectives and Floor Plans of new designs for Summer Cottages, which are romantic, convenient, and cheap. Price, $1.00, by mail.

N. D. C. HODGES, 874 Broadway, New York.
