not even as great as that of feldspar, never that of quartz. Popular beliefs are not scientific facts, and it is a scientific fact that nothing but the natural edge of a diamond crystal will cut glass (frequently with very little visible friction), but everything having the hardness of feldspar will scratch it, as well as glass itself. Popular errors are numerous, and these errors are frequently extensively copied. For instance, a statement appeared some years ago in one of our large magazines that if a precious stone could not be scratched by quartz it would surely be a diamond, and that any jeweller who object to having a diamond tried with a file should be condemned as a fraud.

Polishing the surface of a precious stone can in no way affect its specific gravity if the stone is properly cleaned, and if the operator has sufficient patience and sufficient experience. In these circumstances it is surprising what exact results the various colors of the various precious stones give us. Further, I may say that, after visiting nearly all the known gem-cutting centres and the chief seats of the manufacture of imitation gems, I have never yet known of an instance where the manufacturer cared the slightest what the specific gravity of his product was, providing it had the desired color, or, if it were to imitate a diamond, it had a greater amount of brilliancy than the material made by one of his most successful competitors. The majority neither know nor care what the specific gravity of the gems is any more than does the regular jeweller.

As regards the optical properties of gems no mention is made of the dichroscope, with the use of which the faceting in no way interferes. The prismatic is also of considerable value. In fact, in the determination of rubies, sapphires, and emeralds, their pronounced optical properties, as shown by the dichroscope, or the polariscope and the spectroscopes, together with their specific gravity and their hardness, which is so much greater than that of quartz, will readily distinguish them from everything - "imitation." By means of the spectroscopes we obtain the red band for the ruby, the absorption bands for the garnet, at D, E, and F in the spectrum, or the series of black absorption bands for the zircon. To distinguish glass from a real ruby requires but a glance; to detect the difference between rubies, sapphires, spinels, garnets, and rubellite is not so easy, and in these cases fusibility is of no value.

I think the experience of those who have given attention to this matter is, first, that the specific gravity of the various precious stones is remarkably constant according to their color, seldom varying more than one in the second place of decimals, and, second, that the hardness of the gems is also remarkably constant, and that lines can be more clearly drawn in cut than in natural crystals, which are frequently not transparent, owing to impurities; namely, placing the sapphire at 9, the ruby at 8.6, the aquamarine at 8, and the emerald at 7.8. I should not want to be responsible for the consequences if, at a jeweller's, anyone tried heating a gem in the flame of a spirit lamp or in the flame of a Bunsen burner, any more than I should if a buyer started to try a diamond with a file. Nor should I care to be responsible for the heating in a Bunsen burner of a fine ruby or sapphire, which frequently contains fluid-cavities, or of an emerald, which, if of a fine color, is seldom perfect, owing to internal striae and fluid-cavities, or the topaz, which is affected by heat, and nearly always contains many minute fluid-cavities. The fusibility of the edges of the gems would not distinguish the artificial rubies of Frenzy from those of the true ruby, as both are fusible. Nor would the test of heating in a Bunsen burner be practicable if Mr. Miller were called upon to examine in a few hours from one thousand to fifty thousand gems, and at the same time be perfectly sure that there were no imitation gems in the lot. Such testing needs the experience of the expert, who, before he opens a paper marked "blue or green aquamarine," can tell simply by the weight that the stone in the paper is a blue or green topaz, or who, if the stone is labelled "yellow topaz," can, without even looking at it, but simply by the facility with which it slips through the fingers, determine that it is citrine (decolorized smoky quartz) or the true mineral topaz; or who, if one hundred stones mounted as rings were placed before him in a tray, without supposing the presence of an imitation stone, could at once detect the single imitation present. Nor would fusibility be of any value in

the examination of that class of imitations which are made by dipping heated quartz in green, red, or blue solutions, a common variety of which is known as Mount Blanc, or Alpine ruby.

Finally, few mountings which secure gems are improved by heating them to any extent, and generally the owners do not wish the settings disturbed. As to imitation diamonds there is surely not a jeweller worthy the name who cannot tell a true diamond from a paste one at the first glance, by its adamantine lustre. If it scratches sapphire he may be sure it is a diamond, whereas putting the gem into the flame would not distinguish the diamond from the white topaz or the white zircon or the white sapphire or the white tourmaline or any other white stone that is not fusible.

In conclusion, let me suggest to Mr. Miller the simple test for diamonds, of drawing the stone sharply over a piece of unpainted board in a dark room. Every diamond phosphoresces by friction.

GEORGE F. KUNZ.

Artificial Production of Variation in Types.

In reply to your request for a few words on the question of artificial production of variations, as presented by Mr. West in Science of April 29, I may say that I quite agree with Mr. West in thinking that all attempts to produce new species by mutilations of the parents are foredoomed to failure. The idea that the embryo is in any sense a reflected image of the parents is an illusion from which we are sure to escape. If we substitute germ-cells for "embryo," the question may be answered affirmatively. If the question, as it stands, implies that modifications received during embryonic life, as the result of external influences, would be any more likely to repeat themselves in the next generation than if acquired during adult life, I should say that the assumption is entirely unwarranted.

The form and features of the adult are predetermined in the constitution of the germ-cell. No one denies that external conditions and influences may affect or modify the course of development, but the specific form of the adult is already settled in the germ before development begins. These are mere truisms in embryology.

C. O. WHITMAN.

Clark University, Worcester, Mass.

The "Hongote" Language.

In a series of ten studies of South American Languages, principally from Mi. sources, which I published in the last number of the Proceedings of the American Philosophical Society, one was partly devoted to the "Hongote" language, a vocabulary of which I found in a mass of documents in the British Museum stated to relate to Patagonia. I spoke of it as an independent stock, not related to other languages of that locality. In a letter just received from Dr. Franz Boas, he points out to me that this "Hongote" is certainly Salish, and must have been collected in the Straits of Fuca, on the north-west coast. How it came to be in the MSS. referred to, I cannot imagine, but I hasten to announce the correction as promptly as possible.

D. G. BRIGHTON, M.D.

AMONG THE PUBLISHERS.

The number of the American Journal of Psychology which is about to appear will contain an article on the variations of the knee-jerk by Dr. Noyes, which contains the results of experiments on a case of dementia. Mr. Bolton contributes a digest of the experiments on memory made by Dr. Boas in the Worcester schools. Mr. Fraser shows the psychological origin of the naive realism of the unthinking man and of the philosophic realism of the Scotch school; both are due to a postulate of the sensations of touch as the ultimate realities. The old philosophers have before this
served as subjects for clinical investigation or as "Vereuchisthorie," but they have seldom been so correctly diagnosed as in Mr. Fraser's last two articles. The Journal continues the digests of periodical literature, to which it devotes much care. Such a careful review of the contributions to psychology in its various aspects by specialists in the various lines is believed to be presented by no other periodical; several of the most prominent names of specialists in America will appear among the editors of the Monthly Review, e.g., Professor Donaldson (Nervous System), Professor Cattell (Association, Reaction), Professor Jastrow (Hypnotism), etc.

The American Book Company have issued a new and revised edition of "Cathcart's Literary Reader," a book of selections from English literature which was first published under the editorship of George E. Cathcart some seventeen years ago. They are arranged in periods beginning with the age of Elizabeth and coming down to the present day. No attempt is made to give a complete compendium of English literature, only the leading authors, or those whom the compiler regards as such, but brief mention is made of many others and of their principal works, so that the volume will serve to a certain extent as an introduction to literary history. The writers of the nineteenth century are accorded the larger share of the space, on the ground that they are more interesting to us than those of earlier times, which is undoubtedly true. But we cannot think there is any choice in all cases a judicious one. In the earlier periods he follows the general judgments of critics, giving prominence to those writers who are usually deemed the greatest; but in dealing with his contemporaries, as he himself remarks, the great and established criticism is less available, and his choice, it seems to us, is not always to be commended. The selections in verse are far more numerous than their importance warrants; such verses as those of Poe on "The Bells" and many others that might be mentioned are not being unworthy of a different section. On the other hand, some of our greatest and most influential prose writers, including John Stuart Mill, John Henry Newman, and Matthew Arnold, are not represented at all. Nevertheless, there is much in the book that is valuable and it is certainly superior to the ordinary "reading books," which may indeed teach the pupil to read, but which seldom teach anything of the history of literature or inspire a taste for literary excellence.

The manuscript of Part II of the "Index to the Literature of Explosives," by Charles E. Monroe, is now ready for printing, and, provided a sufficient number of subscriptions are obtained in order to warrant doing so, it will be issued in pamphlet form, of approximately 150 octavo pages, at $1 per copy. Part I, issued in 1888, contains the titles of all articles relating in any way to explosives that appear in the American Journal of Arts and Science, 1819-1886; Philosophical Transactions of Royal Society, 1665-1886; Proceedings of U. S. Naval Institute, 1874-1885; Revue d'Artillerie, etc.

FOSSIL RESINS.
This book is the result of an attempt to collect the scattered notices of fossil resins, exclusive of those on amber. The work is of interest also on account of descriptions given of the insects found embedded in these long-preserved exudations from early vegetation.

SCIENCE.

[Vol. XIX. No. 48

CALAER OF SOCIETIES.

Philosophical Society, Washington.

May 7.—J. P. Ruddings, On the Origin of Igneous Rocks; J. E. Watkins, John Stevens and his Sons, Early American Engineers; H. A. Hazen, Scientific Ballooning.

Exchanges.
[Free of charge to all. If satisfactory character. Address N. D. C. HODGES, 874 Broadway, New York.]

For sale or exchange, Des Aulnay, to vol., 1848 to 1855, including a vol. of natural history, numbers. When, vol. 1, Geo. Regents, vol. 5, Botany, Production of gold-standard works in the United States, 1860, $15; Sillidge Sathurn of Desau. Will sell at very low prices, J. F. James, 1443 Corcoran St., Washington, D. C.

For exchange,—A fine three-kneaded flue in leather covered case, for a photographic camera suitable for making lantern slides. Fair condition, $3, or is near new by O. O. Cox, Mankato, Minn.

To exchange; Experiment Station bulletins and reports for bulletin and reports not in my file. I will send list of what I have for exchange. P. H. ROLPH, Lake City, Florida.

Painted specimens of all colors of Vermont marble for five fossils or crystals. Will be given only for valuable present because of the cost of purchasing. GEO. W. FERBY, State Geologist, Rutland, Vt.

For sale or Exchange for books a complete private chemical laboratory outfit. Includes large beaker balance (2 oz. to 5 pounds), platinum dishes and crucibles, agate mortars, glass-blowing apparatus, etc. For sale in part or whole. Also complete file of Scientific American, 1854-1860. W. U. Coast Survey, 1854-1860. Full particulars to enquirers. F. G. PARDON, Fortuny, Coon.

WANTED.—In exchange for the following works, any standard works on Surgery and on Diseases of Women: Wilson's "American Obstetrics," 1871; "A Guide to the Practice of Medicine," 1869; "Birds of the Northwest," 1868; and "Birds of the Colorado Valley," 1868; Miner's "Land and Game Birds of New England;" Samuel's "Our Northern and Eastern Birds;" all the reports on the Botanical Survey of South Carolina, 1858-1870; no. 11, in one volume; and a complete set of the Reports of the Agricultural and Geographic Survey of South Carolina, lists dates and editions in corresponding. R. ELLIS DILL, Hightstown, Essex.

ADDRESS WANTED.—Will some one please send all books sent as the address of the Secretary of the American Physiological Society. Also that of Herbert Spencer. ADDRESSES WANTED, 100 Madison St., Chicago, Ill.

AUGUSTE OF OLD BOOK DEALERS wanted.—Wishing to obtain a number of old books out of print, or very rare and scarce, or catalogues of rare second-hand book dealers. I am a direct agent for such dealings. Give me the possession of one. W. A. BLAKELY, Chicago, Ill.

POPULAR MANUAL OF VISUAL SPEECH AND VOCAL PHYSIOLOGY.
For use in Colleges and Normal Schools. Price 50 cents sent free by post by N. D. C. HODGES, 874 Broadway, N. Y.
Exhaustion

Horstford's Acid Phosphate.
A wonderful remedy, of the highest value in mental and nervous exhaustion.

Overworked men and women, the nervous, weak and debilitated, will find in the Acid Phosphate a most agreeable, grateful and harmless stimulant, giving renewed strength and vigor to the entire system.

Dr. Edwin F. Vose, Portland, Me., says: "I have used it in my own case when suffering from nervous exhaustion, with gratifying results. I have prescribed it for many of the various forms of nervous debility, and it has never failed to do good." Descriptive pamphlets free.

Sunford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION.—Be sure the word "Horsford's" is on the label. All others are spurious. Never sold in bulk.

NEO-DARWINISM AND NEO-LAMARCKISM.

BY LEESTE F. WARD.

Annual address of the President of the Biological Society of Washington delivered Jan. 24, 1901. A historical and critical review of modern scientific thought relative to heredity, and especially to the problem of the transmission of acquired characters. The following are the several heads involved in the discussion: Stasis of the Problem, Lamarckism, Acquired Characters, Theories of Heredity, Views of Mr. Galton, and the American "School." Application to the Human Race. In no far as views are expressed they are in the main in line with the general current of American thought, opposed to the extreme doctrine of the non-transmissibility of acquired characters.

Price, postage, 25 cents.

N. D. C. HODGES, 874 Broadway, N. Y.

A TEMPORARY BINDER

for Science is now ready, and will be mailed postpaid on receipt of 50 cents.

This binder is strong, durable and elegant, with gilt side-title, and allows the opening of the pages perfectly flat. Any number can be taken out or replaced without disturbing the others, and the papers are not mutilated for subsequent permanent binding. Flap is fastened in this binder. Science is always convenient for reference.

N. D. C. HODGES, Publisher, 874 Broadway, New York.
OUR PLANS.

Within the past six months the use of Science by
scientific men and women as a medium for prompt
publication and weekly discussion, has increased
very materially, so that the pages are now well
filled each week with original matter. As the num-
ber of these promising contributions is increasing,
and the rate of three or four each day, it cannot be
long before Science at its present size will be too
small for the amount of matter offered. We have
under consideration therefore an enlargement of
the paper by one-half, but must first learn the tem-
per of our constituency as to an advance in price
to $0.60, which was the subscription price from
the start for four years, up to June 30, 1887. Further,
to carry out the proposed enlargement, we shall need
hundreds of additional subscribers. If you are not
already a subscriber, are you willing to aid in mak-
ing Science more worthy of American scientific work
by becoming a subscriber?

It goes without saying, that the demand for scien-
tific literature is so great, when compared with that
for literature which is more to the public taste, so
that the receipts of most of the Scientific Journals,
in this country, are not quite for their print, paper
and paper, to say nothing of other items of ex-
 pense. We say this merely to emphasize the fact
that generous and prompt support must be ac-
corded this cause if it is to succeed.
