Cover	Detonating spiral of low-energy detonating cord, "LEDC." The sample consisted of an explosive-loaded lead tube of outside diameter 2.5 millimeters, coiled into a spiral. Detonation began at the outer end of the spiral. The photograph was taken as the detonation, which traveled at 5500 meters per second, reached the inside end. The dispersed lead particles are clearer where they are widely separated. Compare this spiral with the logarithmic spiral of a snail shell on the cover of the issue of 12 January 1962. [C. H. Winning, Explosives Department, E. I. duPont de Nemours & Company, Gibbstown, N.J.]
