## COVER

View of Washington Cathedral taken from the west end of the nave and showing the deviation of about 2 degrees of the nave axis from the axis of the choir at the east end. The architect intentionally designed this deviation, one of many in the cathedral, to enhance the visual effect. See letter by R. T. Feller, page 1669. [Gary Laurish Photography, Washington, D.C.]

## AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

*Science* serves its readers as a forum for the presentation and discussion of important issues related to the advancement of science, including the presentation of minority or conflicting points of view, rather than by publishing only material on which a consensus has been reached. Accordingly, all articles published in *Science*—including editorials, news and comment, and book reviews—are signed and reflect the individual views of the authors and not official points of view adopted by the AAAS or the institutions with which the authors are affiliated.

## The Next Industrial Revolution

We must have a new industrial revolution even if a few of us have to generate it. Other industrial revolutions have come about unplanned. The first was hailed as a way of ennobling human beings by substituting steam and electrical power for their muscles. This it undoubtedly did, but the generation of power brought with it side effects—including air pollution—which, far from being ennobling, were and continue to be degrading to human existence. In the second revolution the multiplication of "things" came about—"things" that at last could be mass-produced, so that people could have more and more of them. Thus was generated the solid-waste problem.

A third revolution was the tremendous growth in industrial chemistry, and the ability to tailor-make chemicals in vast quantities very cheaply, for all kinds of purposes—for example, pesticides intended to selectively destroy forms of life inimical to various groups of human beings. But these turned out not to be so selective; they have upset the little-understood ecological balance, and have polluted and poisoned the waters.

In preparation for the next industrial revolution, I suggest that we revise our vocabulary. For instance, there is no such thing, no such person, as a consumer. We merely *use* "things"; and, according to the law of the conservation of matter, exactly the same mass of material is discarded after use. Thus, as the standard of living goes up, the amount of waste and consequent pollution must go up.

I believe we must base the next industrial revolution—a planned one—on the thesis that there is no such thing as waste, that waste is simply some useful substance that we do not yet have the wit to use. Industry so far is doing only half its job. It performs magnificent feats of scientific, technological, and managerial skill to take things from the land, refine them, and mass-manufacture, mass-market, and mass-distribute them to the so-called consumer; then the same mass of material is left, after use, to the so-called public sector, to be "disposed of." By and large, in our society, the private sector makes the things *before* use and the public sector disposes of them *after* use.

In the next industrial revolution, there must be a loop back from the user to the factory, which industry must close. If American industrial genius can mass-assemble and mass-distribute, why cannot the same genius mass-collect, mass-disassemble, and massively reuse the materials? If American industry should take upon itself the task of closing this loop, then its original design of the articles would include features facilitating their return and remaking. If, on the other hand, we continue to have the private sector make things and the public sector dispose of them, designs for reuse will not easily come about.

We industrial revolutionaries must plan to move more and more into the fields of human service, and not leave such concerns to the so-called public sector. We have seen our food supply grow to abundance in the United States, with fewer and fewer people needed to grow it. We are seeing the automation of factories, with an abundance of "things" provided by fewer and fewer people. On the other hand, we have a shortage of human services and a shortage of people providing these services. It follows quite simply that, if private enterprise is not to dwindle, while the public sector grows to be an all-embracing octopus, then private enterprise must go into the fields of human service.

The next industrial revolution is on our doorstep. Let us be the revolutionaries who shape it, rather than have it happen—and shape us.—ATHELSTAN SPILHAUS, *president, American Association for the Advancement of Science*

This editorial is adapted from a lecture presented at a recent National Industry Conference Board conference on Management and Man in the Computer Age, held in New York. The complete text appeared in the February 1970 issue of *The Conference Board Record*.
