**Nalgene® Labware... better all the time.**

NASA's space program has had more publicized federal financing, but its "giant leap for mankind" has produced data no one could derive from the earth's thin crust, which is almost certainly related to the moon's composition and age.

I suppose that a geologist can be excused for his ignorance of parts of the universe other than Planet Earth, such as the asteroids and comets that may have formed craters, mascons, and lunar maria, or the solar wind and geocorona that can be observed best from the moon, or the globules in interstellar material that we astronomers think may be forming other planetary systems, or the intergalactic material that may be detected by the Apollo lunar surface camera experiment. If he wants to understand Preston Cloud's editorial (18 Sept., p. 1159), he can get some help from the book *Origin of the Solar System* (Macmillan, New York, 1966), an elementary treatment edited by the undersigned.

### Vietnam: AAAS Herbicide Study

Philip Boffey's account (2 Oct., p. 42) of the difficulties of the AAAS team investigating the effects of the military use of herbicides in Vietnam is fine as far as it goes. . . . I was at the Plant Science Laboratories, Fort Detrick, Maryland, when Arthur Westing, a member of the AAAS investigating team, appeared on 8 April to receive a briefing on the activities of the laboratories. His opening comment, made before 15 to 20 members of the laboratory, was "I am the enemy." Matters got worse as he went on to explain that his mission for the AAAS was to assess damage done by herbicides. When asked whether he thought that all changes caused by herbicides should be classified as damaging, he replied that he hadn't thought about possible beneficial effects. He stated that his committee's function was not to balance benefits, such as the prevention of ambush or the detection of enemy supplies in transit, against the deficits, such as the incursion of bamboo; the committee would not, in short, consider the fact that there was a war being fought nor that herbicides were probably the least lethal weapons in use. Before he had

heard a word from the staff of the Plant Science Laboratories Westing made it clear that the committee was going all out to prevent the use of herbicides in Vietnam. Later on, during the briefing, he was very disappointed to learn that the military was not employing paraquat in Vietnam since that would have made his job (of proving that the United States was poisoning Vietnam) a lot easier.

Sometime after that encounter, I read a report prepared by A. H. Westing, E. W. Pfeiffer, J. Lavorel, and L. Matasso entitled "Report on Herbicidal Damage by the United States in Southeastern Cambodia" (1). The report, dated 31 December 1969, was based upon 4 days of "intensive field investigation" from 25 to 29 December. Their trip was within the areas bordering Vietnam, in particular the Parrot's Beak and Fishhook regions which were the prime targets of attack by United States and South Vietnamese forces in April-June 1970. They spent their second and last days at Chup and Mimot, respectively, where large caches of military supplies and a vast underground military headquarters were discovered. One must remember that in December 1969 Prince Sihanouk had not yet admitted that North Vietnamese forces occupied the Cambodian border areas despite 5 years of American and South Vietnamese protests against the Cambodian sanctuaries. Then early in 1970 Sihanouk demanded that Hanoi remove the 45,000 to 60,000 troops (the number varied) and supplies they had stationed in his country, and not very long after that Sihanouk was in exile and the Royal Government of Cambodia (now a republic) went to war against the North Vietnamese. It appears that Cambodia, for 5 years at least, was indeed a very vital sanctuary for the Communists, providing them with a supply and headquarters complex from which they could mount offensive actions in the provinces in the southern part of South Vietnam. It is no wonder then that some of the most intensive defoliation missions were on the heavily forested border in an attempt to create a zone where aerial, if not ground, reconnaissance was facilitated.

Against this background the concluding remarks from the report by Westing *et al.* make interesting reading: "We feel particularly grieved about the innumerable direct and indirect losses suffered by the innocent local populace. The extent of these losses can never be

# ROLE OF CYCLIC AMP IN CELL FUNCTION

Editors: P. Greengard and E. Costa

On the Development and Properties of the Brain Adenyl Cyclase System—G. A. Robison, M. J. Schmidt and E. W. Sutherland / Synthesis and Degradation of Cyclic 3',5'-Adenosine Monophosphate in Frog Erythrocytes—O. A. Rosen et al. / Cyclic Nucleotide Phosphodiesterase—W. Y. Cheung / A Role of Cyclic Nucleotides in Brain Metabolism—N. D. Goldberg et al. / The Measurement of Cyclic Nucleotides by Radioimmunoassay—A. L. Steiner, C. W. Parker and D. M. Kippis / Factors Influencing the Accumulation of Cyclic AMP in Brain Tissue—T. W. Rall and A. Sattin / Effect of Membrane Depolarization and Biogenic Amines on the Formation of Cyclic AMP in Incubated Brain Slices—H. Shimizu, C. R. Creveling and J. W. Daly / Dynamic Aspects of Neurohormonal Control of Cyclic 3',5'-AMP Synthesis in Brain—G. Krishna et al. / Prostaglandins and Cyclic AMP—R. W. Butcher / The Actions of Hormones on the Adenyl Cyclase System—L. Birnbaumer, S. L. Pohl, H. Michiel, J. Krau and M. Bloom / Behavioral and Vegetative Effects Produced by Dibutyl Cyclic AMP Injected into Different Areas of the Brain—G. L. Gessa, G. Krishna, J. Forn, A. Tagliamonte and B. B. Brodie / Index. Cloth, 386 pages, \$15.95 (1970)

# AMPHETAMINES AND RELATED COMPOUNDS

Editors: E. Costa and S. Garattini

In its 58 chapters, 976 pages, and lengthy subject and author indexes, this book is a definitive, timely compendium of information on the amphetamines. SECTIONS: 1. Structure-Activity Relationships of Amphetamines and Halogenated Amphetamines. 2. Distribution and Metabolism. 3. Interaction with Biogenic Amines. 4. Physiological Significance of the Interaction with Biogenic Amines. 5. Effects on the Cardiovascular System. 6. Effects on Food Intake and Lipid Metabolism. 7. Effects on the CNS: Experimental. 8. Effects on the CNS: Clinical. Cloth, \$32.50 (1970)  
"Contains a mother lode of information on the amphetamines . . ."—METABOLISM.

# AN INTRODUCTION TO PSYCHOPHARMACOLOGY

Editors: R. H. Rech and K. E. Moore

This new text is organized around first principles of biochemistry, pharmacology, physiology and psychology, and effectively bridges the span between the theoretical and experimental aspects of the subject and its important clinical applications. CHAPTERS: 1. Some Fundamentals of Pharmacology and Psychology. 2. Essentials of Neuroanatomy and Neurophysiology. 3. Biochemical Correlates of the Behavioral Effects of Drugs. 4. The Limbic System and Its Pharmacological Aspects. 5. Electrophysiological Correlates of the Action of Drugs on the Brain. 6. Agents Affecting Learning and Retention of Conditioned Behavior. 7. Animal Testing and Screening Procedures in Evaluating Psychotropic Drugs. 8. Drug Therapy of Mental Illness: Tranquilizers and Other Depressant Drugs. 9. Drug Therapy of Mental Illness: Treatment of Psychiatric Depression. Index. Cloth, 352 pages, \$9.75 (1970)

determined satisfactorily and will never be compensated adequately. We have seen at first hand how particularly drastic this type of military action is for people whose very existence is so closely tied to the land. Cambodia is a small nation attempting to remain neutral between East and West and to remain at peace with its neighbors despite enormous external pressures from all quarters. We cannot understand and we cannot condone the violations of Cambodian territory by the United States, for which the present report furnishes but one example. Despite a week of free and unhampered travel by automobile, on foot, and by low-flying aircraft along hundreds of kilometers of the border, we could find no evidence of Viet Cong activity in Cambodia; nor did our repeated conversations with Cambodians and Europeans living along the border suggest any such activity."

Westing and Pfeiffer may have written this report in all sincerity but they could have, and should have, gone to other authorities to find out just what was going on militarily at Chup and Mimot. They wrote a beautiful propaganda piece—regardless of their intentions and the ultimate value of their report in assessing 2,4-D and 2,4,5-T damage to rubber plantations—for the Communists. At least one other report on herbicide damage in Cambodia had already been prepared without such propagandistic overtones. . . .

Boffey stated that the AAAS study team "has been denied access to information that is important to the success of the study." We should not expect the military or any other governmental agencies to cooperate with all individuals simply because the AAAS has appointed them to a committee. The team should collectively and individually meet standards required of other government employees who have access to confidential information. An individual's past performance could determine that he was a risk. The "military roadblock" to which Boffey refers may have been Westing's creation, begun months earlier. The AAAS board appointed Matthew Meselson to head the study team and Westing was his first appointee. Nothing in Westing's behavior at Fort Detrick or in his prior writings on the use of herbicides in Vietnam suggests that he meets the minimum standards for objectivity and dispassionate concern for the truth which is the *sine qua non* for scientific inquiry. The AAAS, to maintain its credibility as an organization for the

advancement of science, should reconsider appointments to this study team.

One last word about the AAAS study on herbicides in Vietnam: the full report of the dozens of experts who attended a special conference at Woods Hole last June should have been published in toto in *Science* so that all of us could have evaluated the advice they gave.

Sachs is correct in gathering from my informal remarks at Fort Detrick in April that the mandate from the AAAS to its ad hoc herbicide committee limited this group to an assessment of the biological effects of the herbicides used in Vietnam. He is wrong in suggesting that only potentially adverse effects would be looked into, although it was largely because of a concern over the possibility of such effects that the committee was established in the first place. He is absolutely wrong in claiming that I portrayed the committee as being intent on "going all out to prevent the use of herbicides in Vietnam. Rather the committee is and always has been committed to determining how best to study objectively the ecological and public health consequences of the military use of herbicides [*Science* 167, 37 (1970); *AAAS Bulletin* 15, No. 3, 7 (1970)]. My obviously inept attempts at humor singled out Sachs were intended to break the ice with a group that was in small part hostile to my visit. The subsequent cordial cooperation, assistance, and advice that I have continued to receive from the senior scientific personnel at Fort Detrick suggest to me that they did not share Sach's interpretation of my remarks. A report of the herbicide committee will be presented at the annual meeting of the AAAS in Chicago on 29 December and is to be published shortly thereafter.

I shall not comment on Sachs's lengthy critique of the report of my Cambodian trip (which predates my association with the AAAS committee). It is in the open literature and can be judged by anyone. A fuller account will appear in *Chemical Warfare in Indochina*, to be published by the Macmillan Free Press, in early 1971. For further insights into my personal opinions on
