COVER

Eye movements and visual perception. Recordings of eye movements while subjects view and recognize patterns reveal certain regularities, termed "scanpaths," which have implications for theories of visual pattern perception. See page 308. [Drawing derived from etching by Paul Klee]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.
