COVER

Simultaneous demonstration of catecholamines and neuropeptides-rhesus monkey supraoptic nucleus. A technique for the simultaneous demonstration of monoamines and neuropeptides was used to visualize catecholamine varicosities (blue) which appear to contact the soma and dendrites of a neuropeptide-containing neuron (orange). The method is applicable to numerous neuropeptides, including GnRh, vasopressin, somatostatin, and others (about $\times 750$). See page 1461. [T. H. McNeill and J. R. Slakek, Jr., University of Rochester School of Medicine, Rochester, New York]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to promote the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.
