■ SCIENCE is published weekly on Friday, except the last week in December, by the American Association for the Advancement of Science, 1333 H Street, NW, Washington, DC 20005. Second-class postage (publication No. 484460) paid at Washington, DC, and at an additional entry. Now combined with *The Scientific Monthly* © Copyright © 1986 by the American Association for the Advancement of Science. Domestic individual membership and subscription (51 issues): \$60. Domestic institutional subscription (51 issues): \$98. Foreign postage extra: Canada \$24, other (surface mail) \$27, air-surface via Amsterdam \$65. First class, airmail, school-year, and student rates on request. Single copies \$2.50 (\$3 by mail); back issues \$4 (\$4.50 by mail); Biotechnology issue, \$5.50 (\$6 by mail); classroom rates on request. Change of address: allow 6 weeks, giving old and new addresses and seven-digit account number. Authorization to photocopy material for internal or personal use under circumstances not falling within the fair use provisions of the Copyright Act is granted by AAAS to libraries and other users registered with the Copyright Clearance Center (CCC) Transactional Reporting Service, provided that the base fee of \$1 per copy plus \$0.10 per page is paid directly to CCC, 21 Congress Street, Salem, Massachusetts 01970. The identification code for *Science* is 0036-8075/83 \$1 + .10. Postmaster: Send Form 3579 to *Science*, 1333 H Street, NW, Washington, DC 20005. *Science* is indexed in the *Reader's Guide to Periodical Literature* and in several specialized indexes.

■ The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

**COVER** Test flight in Earth's atmosphere of balloon and gondola system similar to two placed in the atmosphere of Venus in June 1985 by the VEGA spacecraft. These were the first balloons to float in the atmosphere of another planet. Gondola instruments measured in situ meteorological parameters; a world-wide network of 20 ground-based antennas monitored the Venus winds by means of radio signals transmitted by the balloons. See pages 1407-1425. [Photo: V. M. Linkin, Space Research Institute, Moscow, U.S.S.R.; emblem: R. A. Preston, Jet Propulsion Laboratory, California Institute of Technology, Pasadena, CA 91125]

**American Association for the Advancement of Science**

*Science* serves its readers as a forum for the presentation and discussion of important issues related to the advancement of science, including the presentation of minority or conflicting points of view, rather than by publishing only material on which a consensus has been reached. Accordingly, all articles published in *Science*—including editorials, news and comment, and book reviews—are signed and reflect the individual views of the authors and not official points of view adopted by the AAAS or the institutions with which the authors are affiliated.

**Publisher:** William D. Carey

**Editor:** Daniel E. Koshland, Jr.

**Deputy Editors:** Philip H. Abelson (*Engineering and Applied Sciences*); John I. Brauman (*Physical Sciences*); Gardner Lindzey (*Social Sciences*)

**EDITORIAL STAFF**

**Managing Editor:** Patricia A. Morgan

**Assistant Managing Editors:** Nancy J. Hartnagel, John E. Ringle

**Senior Editors:** Eleanore Butz, Lawrence I. Grossman, Ruth Kulstad

**Associate Editors:** Martha Collins, Sylvia Eberhart, William Greaves, Barbara Jasny, Katrina L. Keiner, Edith Meyers

Advertising correspondence should be sent to Tenth Floor, 1515 Broadway, NY 10036. Telephone 212-730-1050.

**Ballooning Around Venus**

On 19 September 1783 a sheep, a rooster, and a duck went aloft—the first passengers in a balloon. Their trip was made possible by the finding of French scientists Joseph and Étienne Montgolfier that a fabric bag filled with hot air would rise. Shortly after their discovery the Montgolfiers launched an unmanned balloon which, to the astonishment of all, flew for 1.5 miles. In November 1783 the first manned flight took place when a balloon carrying two passengers traveled 5.5 miles in 23 minutes. The advancement of science had its protesters in that era, too: when scientists ballooning from Paris landed in a small rural village, they were attacked by peasants terrified by the arrival of beings from outer space.

The Montgolfiers came to their epic invention by observing that smoke flowed upward from fire and deducing that smoke had some mysterious property that they called “levity.” The term seems fairly appropriate to describe ballooning, even though it now has a long tradition of scientific exploration and, sadly but inevitably, military applications. Ballooning conjures visions of a leisurely sightseer, whereas a spacecraft presents an image of a single-minded workaholic. Thus, the description in this issue of *Science* of the arrival of two balloons in the atmosphere of Venus strikes one not only as a scientific landmark but also as a delightful adventure. It seems appropriate that a visit to our nearest planetary neighbor, often only a mere 26 million miles away, was accomplished by a meandering balloon.

The proposal that a balloon could be used to explore the atmosphere of Venus was the idea of Jacques Blamont of France, who then enlisted the support of Soviet, French, and American scientists in a fine example of international cooperation. This cooperation was sustained and intimate as plans evolved from a focused mission to Venus alone to the final alternative of releasing a balloon from each of two Vega spacecraft on their way to Comet Halley. Moreover, the tracking of the balloons across Venus required the dedicated teamwork of scientists and engineers at radio observatories in ten different nations: Australia, Brazil, Canada, Great Britain, West Germany, South Africa, the Soviet Union, Spain, Sweden, and the United States.

These scientists had no easy task. The atmosphere of Venus has been described as a close approximation to the atmosphere of hell. The planet’s surface temperature is about 470°C, in which even heavily insulated instruments may last only an hour. The balloons, therefore, were engineered to settle at an altitude of 54 kilometers, where the temperature is only 32°C. The winds on Venus blow with hurricane velocity, and the atmosphere contains primarily sulfuric acid as well as hydrochloric and hydrofluoric acids. At the balloons’ altitude, solid-state materials could be used, whereas only vacuum tubes could last any time at lower atmospheric levels. The balloons, in fact, produced a wealth of valuable data for 46 hours.

This research is designed largely to satisfy curiosity about Venus, a planet almost the size of Earth but nearer the sun. Venus, like Uranus, rotates differently from the other planets. As in most basic research, there is a serendipitous and practical side in addition to the gathering of pure data. Although Venus rotates on its axis at about one-hundredth the rate of Earth, its atmosphere rotates far more rapidly. The greenhouse effect of Venus and the velocity of rotation of its atmosphere are significantly different from those of Earth. Since it is not easy to create meteorological experiments in a test tube, the prospect of testing ideas about meteorological behavior on Venus is attractive. In California, a state with an atmosphere as close to heaven as is conceivable, there has been some hellish weather recently. But warnings from meteorologists, armed continuously with information from space-based satellites during the recent floods, kept the loss of life very low. Weather prediction is still an imperfect art, but information from distant Venus may one day provide meteorological theory that will benefit earthbound nonballooners.

It is intriguing to speculate that a model for international cooperation was also developed by the teamwork of scientists from the Soviet Union, France, and the United States. Discovering common goals is easier in science than in world politics, but the search for enterprises that transcend international frictions cannot abate. Otherwise, the atmosphere of Earth may resemble that of Venus.—DANIEL E. KOSHLAND, JR.
