■ The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

COVER Electron density, at 3.0 Å resolution, of human rhinovirus 14 complexed with the antiviral agent WIN 52084. This and related compounds inhibit viral uncoating after the virus has become attached to the cell and penetrated the membrane. Shown is the molecular interpretation of the electron density which is not seen in the native structure. (The compound consists of a 4-oxazolinyloxy group linked to a 3-methylisoxazole group by a seven-membered aliphatic chain.) The compound binds into a hydrophobic pocket with viral protein 1, lined by residues that are relatively well conserved among picornaviruses. See page 1286. [T. J. Smith *et al.*, Purdue University and Sterling-Winthrop Research Institute]
