

American Association for the Advancement of Science

Science serves its readers as a forum for the presentation and discussion of important issues related to the advancement of science, including the presentation of minority or conflicting points of view, rather than by publishing only material on which a consensus has been reached. Accordingly, all articles published in *Science*—including editorials, news and comment, and book reviews—are signed and reflect the individual views of the authors and not official points of view adopted by the AAAS or the institutions with which the authors are affiliated.

Publisher: Alvin W. Trivelpiece

Editor: Daniel E. Koshland, Jr.

Deputy Editors: Philip H. Abelson (*Engineering and Applied Sciences*); John I. Brauman (*Physical Sciences*)

EDITORIAL STAFF

Managing Editor: Patricia A. Morgan

Assistant Managing Editor: Nancy J. Hartnagel

Senior Editors: Eleanor Butz, Ruth Kulstad

Associate Editors: Martha Collins, Barbara Jasny, Katrina L. Kelner, Edith Meyers, Phillip D. Szuromi, Kim D. Vandegriff, David F. Voss

Letters Editor: Christine Gilbert

Book Reviews: Katherine Livingston, *editor*; Deborah F. Washburn

This Week in Science: Ruth Levy Guyer

Contributing Editor: Lawrence I. Grossman

Chief Production Editor: Ellen E. Murphy

Editing Department: Lois Schmitt, *head*; Mary McDaniel, Barbara E. Patterson

Copy Desk: Lyle L. Green, Sharon Ryan, Beverly Shields, Anna Victoreen

Production Manager: Karen Schools

Assistant Production Manager: James Landry

Graphics and Production: Holly Bishop, James J. Olivarri, Eleanor Warner

Covers Editor: Grayce Finger

Manuscript Systems Analyst: William Carter

NEWS STAFF

News Editor: Barbara J. Culliton

News and Comment: Colin Norman, *deputy editor*; William Booth, Mark H. Crawford, Constance Holden, Eliot Marshall, Marjorie Sun, John Walsh

Research News: Roger Lewin, *deputy editor*; Deborah M. Barnes, Richard A. Kerr, Gina Kolata, Jean L. Marx, Leslie Roberts, Arthur L. Robinson, M. Mitchell Waldrop

European Correspondent: David Dickson

BUSINESS STAFF

Associate Publisher: William M. Miller, III

Business Staff Manager: Deborah Rivera-Wienhold

Classified Advertising Supervisor: Karen Morgenstern

Membership Recruitment: Gwendolyn Huddle

Member and Subscription Records: Ann Ragland

Guide to Biotechnology Products and Instruments: Shauna S. Roberts

ADVERTISING REPRESENTATIVES

Director: Earl J. Scherago

Traffic Manager: Donna Rivera

Traffic Manager (Recruitment): Gwen Canter

Advertising Sales Manager: Richard L. Charles

Marketing Manager: Herbert L. Burkland

Sales: New York, NY 10036: J. Kevin Henebry, 1515 Broadway (212-730-1050); Scotch Plains, NJ 07076: C. Richard Callis, 12 Unami Lane (201-889-4873); Chicago, IL 60611: Jack Ryan, Room 2107, 919 N. Michigan Ave. (312-337-4973); San Jose, CA 95112: Bob Brindley, 310 S. 16 St. (408-998-4690); Dorset, VT 05251: Fred W. Dieffenbach, Kent Hill Rd. (802-867-5581); Damascus, MD 20872: Rick Sommer, 24808 Shrubbery Hill Ct. (301-972-9270); U.K., Europe: Nick Jones, +44(0647)52918; Telex 42513; FAX (0392) 31645.

Information for contributors appears on page XI of the 26 June 1987 issue. Editorial correspondence, including requests for permission to reprint and reprint orders, should be sent to 1333 H Street, NW, Washington, DC 20005. Telephone: 202-326-6500.

Advertising correspondence should be sent to Tenth Floor, 1515 Broadway, NY 10036. Telephone 212-730-1050 or WU Telex 968082 SCHERAGO.

Research Applications of Lasers

Laser light comes in many sizes, shapes, and colors. The most powerful lasers produce intensities as high as 10^{16} watts per square centimeter, one trillion times the intensity at the surface of the sun and enough to cause fusion reactions. Pulses that are 6×10^{-15} second in duration, consisting of three optical cycles, are now available from dye lasers, and wavelengths shorter than 100 angstroms have been generated by x-ray lasers. Such lasers are interesting objects of study in their own right, but the lasers that operate within the limits are the workhorses: commercially available and approaching turn-key reliability. Lasers are increasingly used as tools for scientific research; with them it is possible to open new avenues of inquiry. In this issue of *Science* are three articles—in geophysics, atomic physics, and chemical physics—that present several ways in which lasers are employed as tools in the laboratory.

Hemley, Bell, and Mao describe some of the uses of lasers in laboratory geophysics. Inside the earth, planetary matter is subjected to pressures that approach several million atmospheres and temperatures in the thousands of degrees. Because direct observation is not possible, an understanding of internal structures and transformations can only be achieved by simulation of these extreme conditions. Small amounts of minerals or their constituents are sandwiched between diamond surfaces and subjected to large static pressure, the latter communicated by the calibrated fluorescence of a ruby chip. An infrared laser beam, passing unhindered through the transparent diamond, may heat the tiny sample, thus raising the compressed environment to high temperature. A visible-wavelength laser can probe the sample for Raman and Brillouin resonances, which reveal the subtleties of the dynamics of the earth and other planets. Raman spectra disclose the remarkable phase transitions of minerals under pressure, and Brillouin scattering permits a quantitative measure of the elastic and acoustic properties important in seismic studies.

Itano, Bergquist, and Wineland describe laser spectroscopy of ions held captive in an electromagnetic trap. In these experiments, quantum states are studied with extraordinary precision; from the results we learn more about atomic clocks and fundamental physics. Confined to a small space and freed from the perturbing influence of neighbors, single atomic ions exhibit quantum-mechanical resonances that are exceedingly narrow in comparison with the broad spectral lines of denser matter. A precisely tuned laser can further constrain the atomic motion by radiation pressure. Lasers that are under strict frequency stabilization can be used to record high-resolution spectra of the isolated ion. In other experiments, this trapped performer can be made to execute quantum jumps, abruptly fluorescing and then going dark.

Jankowiak and Small review experiments that reveal much about the properties of solids at temperatures near absolute zero. In particular they discuss “hole-burning” spectroscopy as a means of extracting harmony from chaos. Amorphous materials, glasses and polymers for example, are disordered on a microscopic scale, and this disorder is reflected in the broad optical absorption spectrum of a collection of guest molecules. The confusion caused by this disorder can be cleared away by carefully exciting a limited group of molecules to higher energy states with a narrow-band laser. These chosen few molecules, now absent from the ground state, are represented by “holes” in the spectrum. This select group can be watched closely: the holes will fill up as the guests rush back to their places. The glass structure can change, however, before the guest molecules have returned, and persistent spectral holes are the result. Even at temperatures below 1 K this structural reorganization continues: no longer thermally activated, the glassy rearrangement instead occurs by quantum tunneling. With laser hole-burning spectroscopy, researchers can probe the time scales of these dynamic events over 15 orders of magnitude, obtaining new information about basic properties of an important class of materials, the disordered solids.

Perhaps the most exciting future role for lasers is in those applications at the limits of performance: electronic pulse generation with ultrashort laser pulses, long baseline laser interferometers for gravity wave detection, and the creation of “squeezed” states of light with exotic statistical properties, to name a few. In these explorations, grand discoveries await researchers equipped with the next generation of laser tools.—DAVID F. VOSS

Research Applications of Lasers
